Validation - Minimum Value:	
Validation - Maximum Value:	

5.9. vw_CallerGroup

A grouping of callers for use in personal rules. A caller is identified by ANI/CallerId, and can be a personal contact, another subscriber, a contact or another personal group.

Additional Information

Used in Personal Call Routing Rules to identify callers. This group can contain members from a subscriber's Personal Address Book or anyone from Unity directory. A subscriber can have a rule such as "If the call is from Caller Group X, route the call to.."

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.	ObjectID
	SubscriberObjectId	char (36 characters)	The unique identifier of the User object to which this group belongs.	ObjectID
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_CallerGroupCreate	Creates a new caller group by executing csp_PersonalGroupCreate, which inserts a new row into tbl_PersonalGroup.
csp_CallerGroupDelete	Deletes a caller group by executing csp_PersonalGroupDelete, which deletes the PersonalGroup object from tbl_PersonalGroup as specified by the @ObjectId parameter.
csp_CallerGroupModify	Updates the properties of a caller group by executing csp_PersonalGroupModify, which updates the attributes of a PersonalGroup object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalGroup object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	The displayname must be unique within a type (CallerGroup and PersonalVoiceMailList) for a given subscriber.
Table/Column Mapping:	tbl_PersonalGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the User object to which this group belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.UserId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.10. vw_CallerGroupMember

A member of a caller group. Members can be another personal group, a user, a personal contact or a contact.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallerGroupObjectId	char (36 characters)	The unique identifier of the PersonalGroup object to which this member belongs.	ObjectID
	MemberCallerGroupObjectId	char (36 characters)	The member of this personal group. If the member is another personal group, the unique identifier of the corresponding PersonalGroup object in tbl_PersonalGroup. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberContactObjectId	char (36 characters)	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberPersonalContactObjectId	char (36 characters)	The member of this personal group. If the member is a personal contact, the unique identifier of the corresponding PersonalContact object in tbl_PersonalContact. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberSubscriberObjectId	char (36 characters)	The member of this personal group. If the member is a user, the unique identifier of the corresponding User object in tbl_User. Otherwise, this attribute is set ot NULL.	ObjectID
PK	ObjectId	char (36 characters)	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.	ObjectID

Stored Procedures

Name	Description
csp_CallerGroupMemberCreate	Adds a new member (user, personal contact, or another personal group) to a caller group by executing csp_PersonalGroupMemberCreate, which inserts a new row into tbl_PersonalGroupMember.
csp_CallerGroupMemberDelete	Removes a member from a caller group by executing csp_PersonalGroupMemberDelete, which deletes a PersonalGroupMember object from tbl_PersonalGroupMember as specified by the @ObjectId parameter.

Column Properties

CallerGroupObjectId

Property Name	Value
Description:	The unique identifier of the PersonalGroup object to which this member belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.PersonalGroupObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberCallerGroupObjectId

Property Name	Value
Description:	The member of this personal group. If the member is another personal group, the unique identifier of the corresponding PersonalGroup object in tbl_PersonalGroup. Otherwise, this attribute is set to NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberPersonalGroupObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberContactObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberPersonalContactObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a personal contact, the unique identifier of the corresponding PersonalContact object in tbl_PersonalContact. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberPersonalContactObjectId

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberSubscriberObjectid

Property Name	Value
Description:	The member of this personal group. If the member is a user, the unique identifier of the corresponding User object in tbl_User. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*Objectid column should contain a non-null value. All other Member*Objectid columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberUserObjectid
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Objectid

Property Name	Value
Description:	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.11. vw_Callhandler

An all-purpose call transfer, greeting, message taking, and routing object. A call handler answers calls, greet callers with recorded prompts and provide them with information and options, route calls, and take messages.

Additional Information

This view is comprised of all the columns in the tbl_Handler and tbl_CallHandler tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	AfterMessageCallActionObjectId	char (36 characters)	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id (i.e., extension) for the call handler.	DtmfAccessId
	EditMsg	smallint (2 bytes)	A flag that determines whether the caller can edit messages.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this CallHandler is a "template" for creating new call handlers.	Bool
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxMsgLen	int (4 bytes)	The maximum recording length (in seconds) for messages left by unidentified callers.	
	MediaSwitchObjectId	char (36 characters)	Default switch to use for transfers.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID
	OneKeyDelay	int (4 bytes)	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.	
	Recipient_ContactObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.	ObjectID
	SendSecureMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "secure."	Bool
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "urgent."	MarkUrgent
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	TimeZone	int (4 bytes)	TimeZone this call handler is operating in.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool
	UseDefaultTimeZone	smallint (2 bytes)	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_CallhandlerGetActiveGreeting	Determines the correct greeting to play based on some information about a call (internal? busy?) and schedules.
csp_CallhandlerGetActiveTransferOption	Retrieve the active transfer option for a specified call handler.
csp_CallhandlerModify	Updates the attributes of a CallHandler object based on the values passed in via the parameters. The @ObjectId parameter identifies the CallHandler object that is updated. This procedure is used for both primary and non-primary call handlers.

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessageCallActionObjectId

Property Name	Value
Description:	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.
Notes:	This value references a tbl_CallAction->ObjectId. Possible actions are: * Say good-bye * Send caller to another call handler, directory handler, interview handler, greetings administrator, hang-up, sign-in, subscriber, subscriber system transfer, or system transfer.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.AfterMessageCallActionObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id (i.e., extension) for the call handler.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId

Property Name	Value
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ \%\'?\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EditMsg

Property Name	Value
Description:	A flag that determines whether the caller can edit messages.
Notes:	Allows callers to be prompted to listen to, add to, rerecord, or delete their messages. Values: 0: Callers cannot edit messages 1: Callers can edit messages
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.EditMsg
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.

Property Name	Value
Notes:	<p>Each subscriber is associated with a call handler, which is referred to as the "primary call handler" for that subscriber. An "application call handler" is just a normal call handler.</p> <p>One important limitation that a primary call handler that an application call handler does not have is that the subscriber administration interface shall only allow one transfer rule to be enabled (the alternate transfer rule). An application call handler has three transfer rules - alternate, standard, and off hours.</p> <p>Another distinction between primary and application call handlers is that primary call handlers must have a DTMFAccessID value assigned to them. A DTMFAccessID value is optional for application call handlers.</p> <p>Values: 0: Not a primary call handler 1: Primary call handler</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this CallHandler is a "template" for creating new call handlers.
Notes:	<p>Used to provide default values for selected columns when creating new call handlers. A value of 1 (i.e., true) means this row is an object template.</p> <p>Values: 0: Not a template 1: Is a template</p>
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsTemplate
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

MaxMsgLen

Property Name	Value
Description:	The maximum recording length (in seconds) for messages left by unidentified callers.

Property Name	Value
Notes:	<p>This value is used when the call handler is set to an action of "Take Message" (either by an after greeting action in the messagingrule table or via a user input action in the menuentry table.</p> <p>This value only gets applied to unidentified callers leaving a message.</p> <p>This value is not used for subscriber-subscriber messaging. Instead the COS for the calling subscriber determines the maximum recorded message length.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MaxMsgLen
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

MediaSwitchObjectId

Property Name	Value
Description:	Default switch to use for transfers.
Notes:	It is possible to override this value by changing the switch id for a specific transfer option.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectId is the same as the tbl_Handler.ObjectId column in the tbl_Handler base table.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OneKeyDelay

Property Name	Value
Description:	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.
Notes:	<p>When a caller interrupts a greeting with a digit, Cisco Unity Connection will wait this number of milliseconds to see if they are going to enter more digits. Once this timeout is reached (or the caller terminates the input with a #), Cisco Unity Connection will do a look-up of the resulting string of numbers for a match with a DTMFAccessID value in the dialing domain. If a match is found, the call is sent to the matching object. If no match is found, the "Error greeting" for the call handler is invoked.</p> <p>If a key is "locked" then this value does not apply. Instead action is taken immediately on that key instead of allowing more digits.</p>
Business Rules:	

Property Name	Value
Developer Notes:	A value of 0 disables one key input. Administrative interface should display value in 100 millisecond increments.
Table/Column Mapping:	tbl_CallHandler.OneKeyDelay
Primary Key:	False
Allow Null:	False
Default Value:	1500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Recipient_ContactObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a contact, this points to the contact.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_ContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters

Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_DistributionListObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this is NULL
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_DistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this points to the subscriber.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.
Notes:	<p>This schedule (commonly referred to as the "active schedule") defines what times of the day are considered "standard" and what times are considered "off hours" in 30 minute increments for each of the 7 days of the week. This is used to determine which greeting and transfer rules are triggered for the call handler when processing calls.</p> <p>This value dictates which transfer rule or greeting rule is active when a call hits it.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ScheduleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendSecureMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "secure."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendSecureMsg
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "urgent."
Notes:	Values: 0: Never - messages left by unidentified calls are never marked urgent. 1: Always - all messages left by unidentified callers are marked urgent. 2: ask - Cisco Unity Connection asks unidentified callers whether to mark their messages urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MarkUrgent
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	TimeZone this call handler is operating in.
Notes:	If NULL, use the TimeZone value from the VMS (vw_LocalVMS.TimeZone).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	Values: 0: The language is the default language defined for the call handler. 1: The language is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.

Property Name	Value
Notes:	Values: 0: The time zone is the default timezone defined for the call handler. 1: The time zone is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.12. vw_CallhandlerNonPrimary

An application call handler. This view contains all the same columns as a call handler object. The value of the "IsPrimary" column must be 0, which indicates this call handler is not a primary call handler for a subscriber.

Additional Information

This view is comprised of all the columns from the tbl_Handler and tbl_CallHandler tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	AfterMessageCallActionObjectId	char (36 characters)	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id (i.e., extension) for the call handler.	DtmfAccessId
	EditMsg	smallint (2 bytes)	A flag that determines whether the caller can edit messages.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this CallHandler is a "template" for creating new call handlers.	Bool
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxMsgLen	int (4 bytes)	The maximum recording length (in seconds) for messages left by unidentified callers.	
	MediaSwitchObjectId	char (36 characters)	Default switch to use for transfers.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID
	OneKeyDelay	int (4 bytes)	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.	
	Recipient_ContactObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.	ObjectID
	SendSecureMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "secure."	Bool
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "urgent."	MarkUrgent
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	TimeZone	int (4 bytes)	TimeZone this call handler is operating in.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool
	UseDefaultTimeZone	smallint (2 bytes)	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

vw_CallhandlerNonPrimary has no stored procedures.

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessageCallActionObjectId

Property Name	Value
Description:	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.
Notes:	This value references a tbl_CallAction->ObjectId. Possible actions are: * Say good-bye * Send caller to another call handler, directory handler, interview handler, greetings administrator, hang-up, sign-in, subscriber, subscriber system transfer, or system transfer.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.AfterMessageCallActionObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id (i.e., extension) for the call handler.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId

Property Name	Value
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\%\'?\'()\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EditMsg

Property Name	Value
Description:	A flag that determines whether the caller can edit messages.
Notes:	Allows callers to be prompted to listen to, add to, rerecord, or delete their messages. Values: 0: Callers cannot edit messages 1: Callers can edit messages
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.EditMsg
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.

Property Name	Value
Notes:	<p>Each subscriber is associated with a call handler, which is referred to as the "primary call handler" for that subscriber. An "application call handler" is just a normal call handler.</p> <p>One important limitation that a primary call handler that an application call handler does not have is that the subscriber administration interface shall only allow one transfer rule to be enabled (the alternate transfer rule). An application call handler has three transfer rules - alternate, standard, and off hours.</p> <p>Another distinction between primary and application call handlers is that primary call handlers must have a DTMFAccessID value assigned to them. A DTMFAccessID value is optional for application call handlers.</p> <p>Values: 0: Not a primary call handler 1: Primary call handler</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this CallHandler is a "template" for creating new call handlers.
Notes:	<p>Used to provide default values for selected columns when creating new call handlers. A value of 1 (i.e., true) means this row is an object template.</p> <p>Values: 0: Not a template 1: Is a template</p>
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsTemplate
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Language

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	LanguageCode
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the Location object to which this handler belongs.
Notes:	
Business Rules:	
Developer Notes:	Although for Cisco Unity Connection, only one primary location per VMS is supported, in a subsequent 5.x product release, multiple location objects per VMS are planned to provide multi-tenant capabilities.
Table/Column Mapping:	tbl_Handler.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxMsgLen

Property Name	Value
Description:	The maximum recording length (in seconds) for messages left by unidentified callers.

Property Name	Value
Notes:	<p>This value is used when the call handler is set to an action of "Take Message" (either by an after greeting action in the messagingrule table or via a user input action in the menuentry table.</p> <p>This value only gets applied to unidentified callers leaving a message.</p> <p>This value is not used for subscriber-subscriber messaging. Instead the COS for the calling subscriber determines the maximum recorded message length.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MaxMsgLen
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

MediaSwitchObjectId

Property Name	Value
Description:	Default switch to use for transfers.
Notes:	It is possible to override this value by changing the switch id for a specific transfer option.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectId is the same as the tbl_Handler.ObjectId column in the tbl_Handler base table.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OneKeyDelay

Property Name	Value
Description:	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.
Notes:	<p>When a caller interrupts a greeting with a digit, Cisco Unity Connection will wait this number of milliseconds to see if they are going to enter more digits. Once this timeout is reached (or the caller terminates the input with a #), Cisco Unity Connection will do a look-up of the resulting string of numbers for a match with a DTMFAccessID value in the dialing domain. If a match is found, the call is sent to the matching object. If no match is found, the "Error greeting" for the call handler is invoked.</p> <p>If a key is "locked" then this value does not apply. Instead action is taken immediately on that key instead of allowing more digits.</p>
Business Rules:	

Property Name	Value
Developer Notes:	A value of 0 disables one key input. Administrative interface should display value in 100 millisecond increments.
Table/Column Mapping:	tbl_CallHandler.OneKeyDelay
Primary Key:	False
Allow Null:	False
Default Value:	1500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Recipient_ContactObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a contact, this points to the contact.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_ContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_DistributionListObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set ot NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this is NULL
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_DistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this points to the subscriber.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.
Notes:	<p>This schedule (commonly referred to as the "active schedule") defines what times of the day are considered "standard" and what times are considered "off hours" in 30 minute increments for each of the 7 days of the week. This is used to determine which greeting and transfer rules are triggered for the call handler when processing calls.</p> <p>This value dictates which transfer rule or greeting rule is active when a call hits it.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ScheduleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendSecureMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "secure."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendSecureMsg
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "urgent."
Notes:	Values: 0: Never - messages left by unidentified calls are never marked urgent. 1: Always - all messages left by unidentified callers are marked urgent. 2: ask - Cisco Unity Connection asks unidentified callers whether to mark their messages urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MarkUrgent
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	TimeZone this call handler is operating in.
Notes:	If NULL, use the TimeZone value from the VMS (vw_LocalVMS.TimeZone).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	Values: 0: The language is the default language defined for the call handler. 1: The language is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.

Property Name	Value
Notes:	Values: 0: The time zone is the default timezone defined for the call handler. 1: The time zone is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.13. vw_CallhandlerNonPrimary_List

A narrow view of an application call handler. This view provides a list of all application call handlers, which is used by CUSA to provide list of application call handlers in drop-down lists. It contains only the ObjectId and DisplayName for each call handler. The value of the "IsPrimary" column must be 0, which indicates this call handler is not a primary call handler for a subscriber.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID

Stored Procedures

vw_CallhandlerNonPrimary_List has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectid is the same as the objectid of its associated base object in tbl_Handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.14. vw_CallhandlerPrimary

A primary call handler for a subscriber. This view contains all the same columns as a call handler object. The value of the "IsPrimary" column must be 1, which indicates this is the primary call handler for a subscriber.

Additional Information

This view is comprised of all the columns from the tbl_Handler and tbl_CallHandler tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	AfterMessageCallActionObjectId	char (36 characters)	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id (i.e., extension) for the call handler.	DtmfAccessId
	EditMsg	smallint (2 bytes)	A flag that determines whether the caller can edit messages.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this CallHandler is a "template" for creating new call handlers.	Bool
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxMsgLen	int (4 bytes)	The maximum recording length (in seconds) for messages left by unidentified callers.	
	MediaSwitchObjectId	char (36 characters)	Default switch to use for transfers.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID
	OneKeyDelay	int (4 bytes)	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.	
	Recipient_ContactObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.	ObjectID
	SendSecureMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "secure."	Bool
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "urgent."	MarkUrgent
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	TimeZone	int (4 bytes)	TimeZone this call handler is operating in.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool
	UseDefaultTimeZone	smallint (2 bytes)	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

vw_CallhandlerPrimary has no stored procedures.

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessageCallActionObjectId

Property Name	Value
Description:	The unique identifier of the action, e.g. "Say good-bye" that Cisco Unity Connection performs after an unidentified caller leaves a message for a call handler.
Notes:	This value references a tbl_CallAction->ObjectId. Possible actions are: * Say good-bye * Send caller to another call handler, directory handler, interview handler, greetings administrator, hang-up, sign-in, subscriber, subscriber system transfer, or system transfer.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.AfterMessageCallActionObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id (i.e., extension) for the call handler.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId

Property Name	Value
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\%\'?\'()\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EditMsg

Property Name	Value
Description:	A flag that determines whether the caller can edit messages.
Notes:	Allows callers to be prompted to listen to, add to, rerecord, or delete their messages. Values: 0: Callers cannot edit messages 1: Callers can edit messages
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.EditMsg
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.

Property Name	Value
Notes:	<p>Each subscriber is associated with a call handler, which is referred to as the "primary call handler" for that subscriber. An "application call handler" is just a normal call handler.</p> <p>One important limitation that a primary call handler that an application call handler does not have is that the subscriber administration interface shall only allow one transfer rule to be enabled (the alternate transfer rule). An application call handler has three transfer rules - alternate, standard, and off hours.</p> <p>Another distinction between primary and application call handlers is that primary call handlers must have a DTMFAccessID value assigned to them. A DTMFAccessID value is optional for application call handlers.</p> <p>Values: 0: Not a primary call handler 1: Primary call handler</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this CallHandler is a "template" for creating new call handlers.
Notes:	<p>Used to provide default values for selected columns when creating new call handlers. A value of 1 (i.e., true) means this row is an object template.</p> <p>Values: 0: Not a template 1: Is a template</p>
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsTemplate
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the Location object to which this handler belongs.
Notes:	
Business Rules:	
Developer Notes:	Although for Cisco Unity Connection, only one primary location per VMS is supported, in a subsequent 5.x product release, multiple location objects per VMS are planned to provide multi-tenant capabilities.
Table/Column Mapping:	tbl_Handler.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxMsgLen

Property Name	Value
Description:	The maximum recording length (in seconds) for messages left by unidentified callers.

Property Name	Value
Notes:	<p>This value is used when the call handler is set to an action of "Take Message" (either by an after greeting action in the messagingrule table or via a user input action in the menuentry table.</p> <p>This value only gets applied to unidentified callers leaving a message.</p> <p>This value is not used for subscriber-subscriber messaging. Instead the COS for the calling subscriber determines the maximum recorded message length.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MaxMsgLen
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

MediaSwitchObjectId

Property Name	Value
Description:	Default switch to use for transfers.
Notes:	It is possible to override this value by changing the switch id for a specific transfer option.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectId is the same as the tbl_Handler.ObjectId column in the tbl_Handler base table.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OneKeyDelay

Property Name	Value
Description:	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.
Notes:	<p>When a caller interrupts a greeting with a digit, Cisco Unity Connection will wait this number of milliseconds to see if they are going to enter more digits. Once this timeout is reached (or the caller terminates the input with a #), Cisco Unity Connection will do a look-up of the resulting string of numbers for a match with a DTMFAccessID value in the dialing domain. If a match is found, the call is sent to the matching object. If no match is found, the "Error greeting" for the call handler is invoked.</p> <p>If a key is "locked" then this value does not apply. Instead action is taken immediately on that key instead of allowing more digits.</p>
Business Rules:	

Property Name	Value
Developer Notes:	A value of 0 disables one key input. Administrative interface should display value in 100 millisecond increments.
Table/Column Mapping:	tbl_CallHandler.OneKeyDelay
Primary Key:	False
Allow Null:	False
Default Value:	1500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Recipient_ContactObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a contact, this points to the contact.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_ContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_DistributionListObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this is NULL
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_DistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this points to the subscriber.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.
Notes:	<p>This schedule (commonly referred to as the "active schedule") defines what times of the day are considered "standard" and what times are considered "off hours" in 30 minute increments for each of the 7 days of the week. This is used to determine which greeting and transfer rules are triggered for the call handler when processing calls.</p> <p>This value dictates which transfer rule or greeting rule is active when a call hits it.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ScheduleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendSecureMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "secure."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendSecureMsg
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "urgent."
Notes:	Values: 0: Never - messages left by unidentified calls are never marked urgent. 1: Always - all messages left by unidentified callers are marked urgent. 2: ask - Cisco Unity Connection asks unidentified callers whether to mark their messages urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MarkUrgent
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	TimeZone this call handler is operating in.
Notes:	If NULL, use the TimeZone value from the VMS (vw_LocalVMS.TimeZone).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this call handler is derived from the call handler object attribute or the default language from the location to which the call handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	Values: 0: The language is the default language defined for the call handler. 1: The language is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	A flag indicating whether the timezone for this call handler is derived from the call handler object attribute or the default timezone from the location to which the call handler belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.

Property Name	Value
Notes:	Values: 0: The time zone is the default timezone defined for the call handler. 1: The time zone is derived from the location to which this call handler belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.15. vw_CallhandlerPrimaryTemplate

A call handler template that is part of a subscriber template.

Additional Information

IsPrimary and IsTemplate must be set for a Callhandler to be in this view.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	EditMsg	smallint (2 bytes)	A flag that determines whether the caller can edit messages.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this CallHandler is a "template" for creating new call handlers.	Bool
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID
	MaxMsgLen	int (4 bytes)	The maximum recording length (in seconds) for messages left by unidentified callers.	
	MediaSwitchObjectId	char (36 characters)	Default switch to use for transfers.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	OneKeyDelay	int (4 bytes)	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.	
	Recipient_ContactObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.	ObjectID
	SendSecureMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "secure."	Bool
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "urgent."	MarkUrgent
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	TimeZone	int (4 bytes)	TimeZone this call handler is operating in.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this call handler template is derived from the call handler template object attribute or the default language from the location to which the call handler template belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UseDefaultTimeZone	smallint (2 bytes)	A flag indicating whether the timezone for this call handler template is derived from the call handler template object attribute or the default timezone from the location to which the call handler template belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_CallhandlerPrimaryTemplateModify	<p>Updates the attributes of a CallHandler template object based on the values passed in via the parameters. The @ObjectId parameter identifies the CallHandler object that is updated. This procedure is used for both primary and non-primary call handlers.</p> <p>Note that a call handler template cannot be changed into a standard call handler object via the csp_CallhandlerTemplateModify stored procedure.</p>

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	<p>Values:</p> <p>0: Ignore - no action taken.</p> <p>1: Hangup - the call is immediately terminated.</p> <p>2: Goto - go to an object such as a call handler, directory handler or interview handler.</p> <p>3: Error - play the error greeting.</p> <p>4: Take a message.</p> <p>5: Skip greeting.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4

Property Name	Value
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

EditMsg

Property Name	Value
Description:	A flag that determines whether the caller can edit messages.
Notes:	Allows callers to be prompted to listen to, add to, rerecord, or delete their messages. Values: 0: Callers cannot edit messages 1: Callers can edit messages
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.EditMsg
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.

Property Name	Value
Notes:	<p>Each subscriber is associated with a call handler, which is referred to as the "primary call handler" for that subscriber. An "application call handler" is just a normal call handler.</p> <p>One important limitation that a primary call handler that an application call handler does not have is that the subscriber administration interface shall only allow one transfer rule to be enabled (the alternate transfer rule). An application call handler has three transfer rules - alternate, standard, and off hours.</p> <p>Another distinction between primary and application call handlers is that primary call handlers must have a DTMFAccessID value assigned to them. A DTMFAccessID value is optional for application call handlers.</p> <p>Values: 0: Not a primary call handler 1: Primary call handler</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this CallHandler is a "template" for creating new call handlers.
Notes:	<p>Used to provide default values for selected columns when creating new call handlers. A value of 1 (i.e., true) means this row is an object template.</p> <p>Values: 0: Not a template 1: Is a template</p>
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsTemplate
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxMsgLen

Property Name	Value
Description:	The maximum recording length (in seconds) for messages left by unidentified callers.

Property Name	Value
Notes:	<p>This value is used when the call handler is set to an action of "Take Message" (either by an after greeting action in the messagingrule table or via a user input action in the menuentry table.</p> <p>This value only gets applied to unidentified callers leaving a message.</p> <p>This value is not used for subscriber-subscriber messaging. Instead the COS for the calling subscriber determines the maximum recorded message length.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MaxMsgLen
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:

Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectId is the same as the tbl_Handler.ObjectId column in the tbl_Handler base table.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OneKeyDelay

Property Name	Value
Description:	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.
Notes:	<p>When a caller interrupts a greeting with a digit, Cisco Unity Connection will wait this number of milliseconds to see if they are going to enter more digits. Once this timeout is reached (or the caller terminates the input with a #), Cisco Unity Connection will do a look-up of the resulting string of numbers for a match with a DTMFAccessID value in the dialing domain. If a match is found, the call is sent to the matching object. If no match is found, the "Error greeting" for the call handler is invoked.</p> <p>If a key is "locked" then this value does not apply. Instead action is taken immediately on that key instead of allowing more digits.</p>
Business Rules:	

Property Name	Value
Developer Notes:	A value of 0 disables one key input. Administrative interface should display value in 100 millisecond increments.
Table/Column Mapping:	tbl_CallHandler.OneKeyDelay
Primary Key:	False
Allow Null:	False
Default Value:	1500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Recipient_ContactObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a contact, this points to the contact.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_ContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_DistributionListObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this is NULL
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_DistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this points to the subscriber.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.
Notes:	<p>This schedule (commonly referred to as the "active schedule") defines what times of the day are considered "standard" and what times are considered "off hours" in 30 minute increments for each of the 7 days of the week. This is used to determine which greeting and transfer rules are triggered for the call handler when processing calls.</p> <p>This value dictates which transfer rule or greeting rule is active when a call hits it.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ScheduleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendSecureMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "secure."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendSecureMsg
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "urgent."
Notes:	Values: 0: Never - messages left by unidentified calls are never marked urgent. 1: Always - all messages left by unidentified callers are marked urgent. 2: ask - Cisco Unity Connection asks unidentified callers whether to mark their messages urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MarkUrgent
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	TimeZone this call handler is operating in.
Notes:	If NULL, use the TimeZone value from the VMS (vw_LocalVMS.TimeZone).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this call handler template is derived from the call handler template object attribute or the default language from the location to which the call handler template belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	Values: 0: The language is the default language defined for the call handler template. 1: The language is derived from the location to which this call handler template belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	A flag indicating whether the timezone for this call handler template is derived from the call handler template object attribute or the default timezone from the location to which the call handler template belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.

Property Name	Value
Notes:	Values: 0: The time zone is the default timezone defined for the call handler template. 1: The time zone is derived from the location to which this call handler template belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.16. vw_CallhandlerTemplate

A template for a call handler object. This view contains all the same columns as a call handler object. The value of the "IsTemplate" column must be 1, which indicates this row of a call handler object is a template.

Additional Information

This view is comprised of all the columns from the tbl_Handler and tbl_CallHandler tables.

Does not return primary call handlers, since they are not stand alone templates but part of a subscriber template.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	EditMsg	smallint (2 bytes)	A flag that determines whether the caller can edit messages.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this CallHandler is a "template" for creating new call handlers.	Bool
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID
	MaxMsgLen	int (4 bytes)	The maximum recording length (in seconds) for messages left by unidentified callers.	
	MediaSwitchObjectId	char (36 characters)	Default switch to use for transfers.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	OneKeyDelay	int (4 bytes)	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.	
	Recipient_ContactObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.	ObjectID
	SendSecureMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "secure."	Bool
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller can mark a message as "urgent."	MarkUrgent
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	TimeZone	int (4 bytes)	TimeZone this call handler is operating in.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this call handler template is derived from the call handler template object attribute or the default language from the location to which the call handler template belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UseDefaultTimeZone	smallint (2 bytes)	A flag indicating whether the timezone for this call handler template is derived from the call handler template object attribute or the default timezone from the location to which the call handler template belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_CallhandlerTemplateCreate	<p>Creates a new call handler template by inserting a new row into tbl_CallHandler. A call handler template is identical to a call handler except for one distinction --- IsTemplate column = true (1) signifies that a call handler object is a template. This procedure is used to create both primary and non-primary call handlers.</p> <p>csp_CallhandlerTemplateCreate sets the callhandler template attributes by using the values passed in and the default values from the specified callhandler template (optional). Note that a call handler template is optional to create a call handler template.</p> <p>In addition to creating a new handler and callhandler object, this stored procedure also creates the sub collections of call action, greeting, transferoption and menuentry objects associated with this callhandler template. If a VoiceName is passed in, a new voice name for the call handler template is created (executes csp_StreamFileModify) by activating an existing StreamFile object in tbl_StreamFile that was allocated using csp_AllocateVoiceFile.</p> <p>To change the attributes for a call handler template, see csp_CallhandlerTemplateModify.</p>
csp_CallhandlerTemplateDelete	Deletes a CallHandler template object from tbl_CallHandler as specified by the @ObjectId parameter.
csp_CallhandlerTemplateModify	<p>Updates the attributes of a CallHandler template object based on the values passed in via the parameters. The @ObjectId parameter identifies the CallHandler object that is updated. This procedure is used for both primary and non-primary call handlers.</p> <p>Note that a call handler template cannot be changed into a standard call handler object via the csp_CallhandlerTemplateModify stored procedure.</p>

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

EditMsg

Property Name	Value
Description:	A flag that determines whether the caller can edit messages.
Notes:	Allows callers to be prompted to listen to, add to, rerecord, or delete their messages. Values: 0: Callers cannot edit messages 1: Callers can edit messages
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.EditMsg
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a "primary" call handler for a subscriber, or an "application" call handler.

Property Name	Value
Notes:	<p>Each subscriber is associated with a call handler, which is referred to as the "primary call handler" for that subscriber. An "application call handler" is just a normal call handler.</p> <p>One important limitation that a primary call handler that an application call handler does not have is that the subscriber administration interface shall only allow one transfer rule to be enabled (the alternate transfer rule). An application call handler has three transfer rules - alternate, standard, and off hours.</p> <p>Another distinction between primary and application call handlers is that primary call handlers must have a DTMFAccessID value assigned to them. A DTMFAccessID value is optional for application call handlers.</p> <p>Values: 0: Not a primary call handler 1: Primary call handler</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this CallHandler is a "template" for creating new call handlers.
Notes:	<p>Used to provide default values for selected columns when creating new call handlers. A value of 1 (i.e., true) means this row is an object template.</p> <p>Values: 0: Not a template 1: Is a template</p>
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.IsTemplate
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Language

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	LanguageCode
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the Location object to which this handler belongs.
Notes:	
Business Rules:	
Developer Notes:	Although for Cisco Unity Connection, only one primary location per VMS is supported, in a subsequent 5.x product release, multiple location objects per VMS are planned to provide multi-tenant capabilities.
Table/Column Mapping:	tbl_Handler.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxMsgLen

Property Name	Value
Description:	The maximum recording length (in seconds) for messages left by unidentified callers.

Property Name	Value
Notes:	<p>This value is used when the call handler is set to an action of "Take Message" (either by an after greeting action in the messagingrule table or via a user input action in the menuentry table.</p> <p>This value only gets applied to unidentified callers leaving a message.</p> <p>This value is not used for subscriber-subscriber messaging. Instead the COS for the calling subscriber determines the maximum recorded message length.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MaxMsgLen
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

MediaSwitchObjectId

Property Name	Value
Description:	Default switch to use for transfers.
Notes:	It is possible to override this value by changing the switch id for a specific transfer option.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CallHandler object.
Notes:	The value of this objectId is the same as the tbl_Handler.ObjectId column in the tbl_Handler base table.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OneKeyDelay

Property Name	Value
Description:	The amount of time (in milliseconds) that Cisco Unity Connection waits for additional input after callers press a single key that is not locked. If there is no input within this time, Cisco Unity Connection performs the action assigned to the single key.
Notes:	<p>When a caller interrupts a greeting with a digit, Cisco Unity Connection will wait this number of milliseconds to see if they are going to enter more digits. Once this timeout is reached (or the caller terminates the input with a #), Cisco Unity Connection will do a look-up of the resulting string of numbers for a match with a DTMFAccessID value in the dialing domain. If a match is found, the call is sent to the matching object. If no match is found, the "Error greeting" for the call handler is invoked.</p> <p>If a key is "locked" then this value does not apply. Instead action is taken immediately on that key instead of allowing more digits.</p>
Business Rules:	

Property Name	Value
Developer Notes:	A value of 0 disables one key input. Administrative interface should display value in 100 millisecond increments.
Table/Column Mapping:	tbl_CallHandler.OneKeyDelay
Primary Key:	False
Allow Null:	False
Default Value:	1500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Recipient_ContactObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a contact, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a contact, this points to the contact.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_ContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_DistributionListObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a distribution list, the unique identifier of the DistributionList object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this is NULL
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_DistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The recipient for this call handler. If the recipient is a subscriber, the unique identifier of the Subscriber object where the recorded message of a call handler should be routed. Otherwise, this attribute is set to NULL.
Notes:	In the case of a primary call handler associated with a subscriber, this points to the subscriber.
Business Rules:	Only one Recipient_ column may be filled in
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the schedule set Cisco Unity Connection will use for making standard versus off hours decisions within this call handler.
Notes:	<p>This schedule (commonly referred to as the "active schedule") defines what times of the day are considered "standard" and what times are considered "off hours" in 30 minute increments for each of the 7 days of the week. This is used to determine which greeting and transfer rules are triggered for the call handler when processing calls.</p> <p>This value dictates which transfer rule or greeting rule is active when a call hits it.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.ScheduleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendSecureMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "secure."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendSecureMsg
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller can mark a message as "urgent."
Notes:	Values: 0: Never - messages left by unidentified calls are never marked urgent. 1: Always - all messages left by unidentified callers are marked urgent. 2: ask - Cisco Unity Connection asks unidentified callers whether to mark their messages urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MarkUrgent
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	TimeZone this call handler is operating in.
Notes:	If NULL, use the TimeZone value from the VMS (vw_LocalVMS.TimeZone).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallHandler.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this call handler template is derived from the call handler template object attribute or the default language from the location to which the call handler template belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	Values: 0: The language is the default language defined for the call handler template. 1: The language is derived from the location to which this call handler template belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	A flag indicating whether the timezone for this call handler template is derived from the call handler template object attribute or the default timezone from the location to which the call handler template belongs. Always use the Timezone column - if this is set, then the column Timezone is being derived directly from the location.

Property Name	Value
Notes:	Values: 0: The time zone is the default timezone defined for the call handler template. 1: The time zone is derived from the location to which this call handler template belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.17. vw_chk_MediaPort_DisabledWithPortMemoryRefs

A check for telephony ports that (1) are unable to send MWI requests to the phone system and (2) are referenced by MWI devices that are active and in the "On" state and require port memory.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	lvvarchar (256 characters)	Name of media port.	MediaPortDisplayName
	NumNotificationMwi	int (4 bytes)	The number of ports that (1) are unable to send MWI requests to the phone system and (2) are referenced by MWI devices that are active and in the "On" state and require port memory.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPort object.	ObjectID

Stored Procedures

vw_chk_MediaPort_DisabledWithPortMemoryRefs has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	Name of media port.

Validation - Maximum Value:	

5.20. vw_chk_MediaPort_PortsDeleted

A check for deleted ports that are still running in a role. Shows the telephony ports that have been deleted from the Cisco Unity Connection configuration but are still running inside the Voice Processing role.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	PortCount	int (4 bytes)		
	VmsServerName	nvarchar (64 characters)	The name of the server.	
PK	VmsServerObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a VMSServer object.	ObjectID

Stored Procedures

vw_chk_MediaPort_PortsDeleted has no stored procedures.

Column Properties

PortCount

Property Name	Value
Description:	
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.

Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.21. vw_chk_MediaPort_PortsNeedRestart

A check for media ports that need to be restarted. Shows the telephony ports that have been have been reconfigured in such a way that the ports need to be restarted for the changes to take effect.

Additional Information

Telephony port objects run inside the Voice Processing role. These objects can respond to some configuration changes dynamically (i.e., during the next call). Other changes require the port to be restarted to take effect.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	PortCount	int (4 bytes)		
	VmsServerName	nvarchar (64 characters)	The name of the server.

DisplayName

Property Name	Value
Description:	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)

Property Name	Value
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.30. vw_chk_MediaPortGroup_NoCCMTFTPServers

A check for Skinny media port groups without defined Cisco Unified Communications Manager TFTP servers. Shows the Skinny port groups having at least one port configured for SCCP over a TLS connection but no Cisco Unified Communications Manager TFTP servers.

Additional Information

TFTP to the Cisco Unified Communications Manager cluster is required for the Cisco Unity Connection telephony port to establish a TLS Skinny connection to the cluster.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName

5.39. vw_chk_MediaSwitch_DupPIMG

A check for duplicate PIMG port groups. Shows the phone systems (MediaSwitch) having two or more PIMG port groups with the same HostOrIPAddress (Case-insensitive comparison). HostOrIPAddress is found in MediaRemoteService.

Additional Information

This check does not account for hostname resolving to an IP address that is a duplicate on one in another row.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	HostOrIPAddress	lvarchar (256 characters)	The DNS name or IP address of the computer hosting the remote service .	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaSwitch object.	ObjectID
	PimgCount	int (4 bytes)	Number of PIMG port groups found with the same HostOrIPAddress.	

Stored Procedures

vw_chk_MediaSwitch_DupPIMG has no stored procedures.

5.41. vw_chk_MediaSwitch_MediaPortHuntOrderDuplicated

A check for media ports configured to use the same hunt order. Shows the phone systems (tbl_MediaSwitch) having multiple telephony ports configured to use the same hunt order.

Additional Information

One ports configured to have some sort of outdial capability (notifications, MWIs, etc.) are included in the search.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	HuntOrder	smallint (2 bytes)	The position of this line in the hunt group as configured on the switch, with the highest numbers representing the lines that are first ("use me first") in the hunt group. Ports can have the same HuntOrder, and in that case ports will be selected on a round-robin (or longest-idle) basis.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaSwitch object.	ObjectID
	PortCount	int (4 bytes)		

Stored Procedures

vw_chk_MediaSwitch_MediaPortHuntOrderDuplicated has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.DisplayName

Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

HuntOrder

Property Name	Value
Description:	The position of this line in the hunt group as configured on the switch, with the highest numbers representing the lines that are first ("use me first") in the hunt group. Ports can have the same HuntOrder, and in that case ports will be selected on a round-robin (or longest-idle) basis.
Notes:	<p>To determine what port to use for an outgoing call or MWI request, Cisco Unity Connection examines the HuntOrder of all the MediaPort objects that are (1) assigned the switch to which the call or MWI request should be directed and (2) allowed to perform the requested function. Cisco Unity selects the available MediaPort with the highest value HuntOrder. Selecting the highest available HuntOrder is intended to avoid collisions with incoming calls, which the switch will tend to direct to the lowest-numbered ports.</p> <p>Thus HuntOrder is a relative ranking between MediaPorts assigned to the same switch. It doesn't necessarily need to exactly match the programming on the switch.</p>
Business Rules:	Hunt order is not available for SIP ports. However, hunt order is available for PIMG ports.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.HuntOrder
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)

5.47. vw_chk_MediaSwitch_PortGroupsMismatchedMwiReqPortSpecific

This query lists the phone systems having at least one port group configured for in-band MWI and at least one port group configured for out-of-band. The list includes the number of port groups in each category. The column that contains the in-band/out-of-band setting is tbl_MediaPortGroup.MwiReqPortSpecific.

Additional Information

For a given phone system (row in tbl_MediaSwitch) all of its port groups should normally be configured to send MWI requests either in-band or out-of-band (or not at all).

In-band requires the use of a Unity port and telephone line (e.g., DTMF). Out-of-band does not require the use of a Unity port. In the case of PIMG integrations, out-of-band usually means that the PIMG forwards the MWI request to the PBX via a serial cable.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	numInBand	int (4 bytes)	The number of media port groups enabled for MWI and having MwiReqPortSpecific = true.	
	numOutOfBand	int (4 bytes)	The number of port groups enabled for MWI and having MwiReqPortSpecific = false.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaSwitch object.	ObjectID

5.48. vw_Configuration

Configuration data used by Cisco Unity Connection components and applications.

Additional Information

This view is comprised of all the columns in the tbl_Configuration table.

The view uses a user defined function to generate one of the columns.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Configuration-MetadataObjectId	char (36 characters)	The unique identifier to a node that is a pointer into another table that will contain validation information.	ObjectID
	DefaultValueBool	smallint (2 bytes)		Bool
	DefaultValueDate	datetime (8 bytes)		
	DefaultValueFloat	float (8 bytes)		
	DefaultValueGuid	char (36 characters)		ObjectID
	DefaultValueLong	int (4 bytes)		
	DefaultValueString	nvarchar (512 characters)		
	FullName	nvarchar (380 characters)	The fully qualified name of the configuration setting node.	Configuration-FullName
	HasChildNodes	smallint (2 bytes)	Indicates whether or not the node has any child nodes.	Bool
	LastModifiedBy-Component	nvarchar (256 characters)	The name of the component that last modified this node.	Component-Name
	LastModifiedTime	datetime (8 bytes)	The date and time of the last modification.	
	MaxVal	int (4 bytes)	For integer values, the maximum allowed value.	
	MinVal	int (4 bytes)	For integer values, the minimum allowed value.	
	Name	nvarchar (256 characters)	The text name of the node.	Configuration-Name
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Configuration node.	ObjectID
	ParentId	char (36 characters)	The unique identifier of the node parent.	ObjectID
	RegexValidation	nvarchar (64 characters)	For string values, a regular expression string used to validate the string value.	
	RequiresRestart	smallint (2 bytes)	A flag indicating whether or not CUC will need to be restarted if this setting is changed.	Bool
	ResetToDefaultOnUpgrade	smallint (2 bytes)	A flag indicating whether or not this setting's value should be migrated during upgrades.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	Type	int (4 bytes)	The data type of the node value.	Configuration-NodeType
	UserSetting	smallint (2 bytes)	A flag indicating whether this Configuration object is accessible to an end user (administrator). Some settings are essentially internal, and not meant to be configured by end users.	Bool
	Value	lvarchar (512 characters)		
	ValueBool	smallint (2 bytes)	The value of the node if the node is of type bool.	Bool
	ValueDate	datetime (8 bytes)	The value of the node if the node is of type datetime.	
	ValueFloat	float (8 bytes)	The value of the node if the node is of type float.	
	ValueGuid	char (36 characters)	The value of the node if the node is of type ObjectID	ObjectID
	ValueLong	int (4 bytes)	The value of the node if the node is of type long.	
	ValueString	lvarchar (512 characters)	The value of the node if the node is of type string.	

Stored Procedures

Name	Description
csp_ConfigurationModify	Updates the attributes of a specified instance of a Configuration node based on the values passed in via the parameters.
csp_ConfigurationRetrieve	Retrieves information about an existing configuration node.

Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultValueString

Property Name	Value
Description:	
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.DefaultValueString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (512 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

FullName

Property Name	Value
Description:	The fully qualified name of the configuration setting node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.FullName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ConfigurationFullName
SQL Data Type/Length:	lvarchar (380 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	512 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

HasChildNodes

Property Name	Value
Description:	Indicates whether or not the node has any child nodes.
Notes:	Values: 0: The node does not have any child nodes 1: The node has child nodes
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.HasChildNodes
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedByComponent

Property Name	Value
Description:	The name of the component that last modified this node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedByComponent
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ComponentName
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

LastModifiedTime

Property Name	Value
Description:	The date and time of the last modification.
Notes:	This column is updated whenever csp_ConfigurationModify is used to update a node.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxVal

Property Name	Value
Description:	For integer values, the maximum allowed value.
Notes:	NULL indicates there is no maximum set.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MaxVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MinVal

Property Name	Value
Description:	For integer values, the minimum allowed value.
Notes:	NULL indicates there is no minimum specified.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MinVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Name

Property Name	Value
Description:	The text name of the node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.Name
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ConfigurationName

Property Name	Value
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Configuration node.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ParentId

Property Name	Value
Description:	The unique identifier of the node parent.
Notes:	Only one node, the top-most node in the hierarchy, can have a NULL ParentId.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ParentId
Primary Key:	False

Property Name	Value
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RegexValidation

Property Name	Value
Description:	For string values, a regular expression string used to validate the string value.
Notes:	NULL indicates there is no regular expression checking for this value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RegexValidation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiresRestart

Property Name	Value
Description:	A flag indicating whether or not CUC will need to be restarted if this setting is changed.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RequiresRestart
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ResetToDefaultOnUpgrade

Property Name	Value
Description:	A flag indicating whether or not this setting's value should be migrated during upgrades.
Notes:	<p>Setting this flag to false (0) will cause the value of this setting to be migrated during an upgrade. This will be the case for most settings.</p> <p>Setting this flag to true (1) will prevent the value of this setting from being migrated (copied) during an upgrade. After the upgrade, the setting will have the same value that the corresponding setting on a fresh install would have.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ResetToDefaultOnUpgrade
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Type

Property Name	Value
Description:	The data type of the node value.
Notes:	<p>Possible node data types are bool, datetime, float, long, string, and null.</p> <p>Values:</p> <p>1: The node contains a NULL value.</p> <p>11: The node contains a bool type value.</p> <p>3: The node contains a long value.</p> <p>4: The node contains a float value.</p> <p>7: The node contains a date/time value.</p> <p>8: The node contains a string value.</p> <p>88: The node contains a GUID (unique identifier) value.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.Type
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	ConfigurationNodeType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UserSetting

Property Name	Value
Description:	A flag indicating whether this Configuration object is accessible to an end user (administrator). Some settings are essentially internal, and not meant to be configured by end users.
Notes:	<p>Values:</p> <p>0: End user cannot access this object</p> <p>1: An end user can access this object</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.UserSetting
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Value

Property Name	Value
Description:	
Notes:	A node can have a NULL value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (512 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueBool

Property Name	Value
Description:	The value of the node if the node is of type bool.
Notes:	
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_Configuration.ValueBool
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueDate

Property Name	Value
Description:	The value of the node if the node is of type datetime.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ValueDate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueFloat

Property Name	Value
Description:	The value of the node if the node is of type float.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ValueFloat
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	float (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueGuid

Property Name	Value
Description:	The value of the node if the node is of type ObjectId
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ValueGuid
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueLong

Property Name	Value
Description:	The value of the node if the node is of type long.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ValueLong
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ValueString

Property Name	Value
Description:	The value of the node if the node is of type string.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.ValueString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (512 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.49. vw_Configuration_AdvSetting_Conversations

Contains the configuration data for Conversation settings. The primary purpose of this view is to control access to the Advanced settings in CUSA for configuring the Conversation settings.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	FullName	lvvarchar (380 characters)	The fully qualified name of the node.	Configuration-FullName
	LastModifiedBy-Component	lvvarchar (256 characters)	The name of the component that last modified this node.	Component-Name
	LastModifiedTime	datetime (8 bytes)	The date and time of the last modification.	
	MaxVal	int (4 bytes)	For integer values, the maximum allowed value.	
	MinVal	int (4 bytes)	For integer values, the minimum allowed value.	
	RegexValidation	nvarchar (64 characters)	For string values, a regular expression string used to validate the string value.	
	RequiresRestart	smallint (2 bytes)	A flag indicating whether or not CUC will need to be restarted if this setting is changed.	Bool
	Type	int (4 bytes)	The data type of the node value.	Configuration-NodeType
	UserSetting	smallint (2 bytes)	A flag indicating whether this Configuration object is accessible to an end user (administrator). Some settings are essentially internal, and not meant to be configured by end users.	Bool
	Value	lvvarchar (512 characters)	Value of the node.	

Stored Procedures

vw_Configuration_AdvSetting_Conversations has no stored procedures.

Column Properties

FullName

Property Name	Value
Description:	The fully qualified name of the node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.FullName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ConfigurationFullName
SQL Data Type/Length:	lvarchar (380 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	512 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedByComponent

Property Name	Value
Description:	The name of the component that last modified this node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedByComponent
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ComponentName
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedTime

Property Name	Value
Description:	The date and time of the last modification.
Notes:	This column is updated whenever csp_ConfigurationModify is used to update a node.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL

	LastModifiedTime	datetime (8 bytes)	The date and time of the last modification.	
	MaxVal	int (4 bytes)	For integer values, the maximum allowed value.	
	MinVal	int (4 bytes)	For integer values, the minimum allowed value.	
	RegexValidation	nvarchar (64 characters)	For string values, a regular expression string used to validate the string value.	
	RequiresRestart	smallint (2 bytes)	A flag indicating whether or not CUC will need to be restarted if this setting is changed.	Bool
	Type	int (4 bytes)	The data type of the node value.	Configuration-NodeType
	UserSetting	smallint (2 bytes)	A flag indicating whether this Configuration object is accessible to an end user (administrator). Some settings are essentially internal, and not meant to be configured by end users.	Bool
	Value	lvarchar (512 characters)	Value of the node.	

Stored Procedures

vw_Configuration_AdvSetting_Groupware has no stored procedures.

Column Properties

FullName

Property Name	Value
Description:	The fully qualified name of the node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.FullName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ConfigurationFullName
SQL Data Type/Length:	lvarchar (380 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	512 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedByComponent

Property Name	Value
Description:	The name of the component that last modified this node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedByComponent
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ComponentName
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedTime

Property Name	Value
Description:	The date and time of the last modification.
Notes:	This column is updated whenever csp_ConfigurationModify is used to update a node.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxVal

Property Name	Value
Description:	For integer values, the maximum allowed value.
Notes:	NULL indicates there is no maximum set.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MaxVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MinVal

Property Name	Value
Description:	For integer values, the minimum allowed value.
Notes:	NULL indicates there is no minimum specified.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MinVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RegexValidation

Property Name	Value
Description:	For string values, a regular expression string used to validate the string value.
Notes:	NULL indicates there is no regular expression checking for this value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RegexValidation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiresRestart

Property Name	Value
Description:	A flag indicating whether or not CUC will need to be restarted if this setting is changed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RequiresRestart
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Type

Property Name	Value
Description:	The data type of the node value.
Notes:	Values: 1: The node contains a NULL value. 11: The node contains a bool type value. 3: The node contains a long value. 4: The node contains a float value. 7: The node contains a date/time value. 8: The node contains a string value. 88: The node contains a GUID (unique identifier) value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.Type

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	FullName	lvarchar (380 characters)	The fully qualified name of the node.	Configuration-FullName
	LastModifiedBy-Component	lvarchar (256 characters)	The name of the component that last modified this node.	Component-Name
	LastModifiedTime	datetime (8 bytes)	The date and time of the last modification.	
	MaxVal	int (4 bytes)	For integer values, the maximum allowed value.	
	MinVal	int (4 bytes)	For integer values, the minimum allowed value.	
	RegexValidation	nvarchar (64 characters)	For string values, a regular expression string used to validate the string value.	
	RequiresRestart	smallint (2 bytes)	A flag indicating whether or not CUC will need to be restarted if this setting is changed.	Bool
	Type	int (4 bytes)	The data type of the node value.	Configuration-NodeType
	UserSetting	smallint (2 bytes)	A flag indicating whether this Configuration object is accessible to an end user (administrator). Some settings are essentially internal, and not meant to be configured by end users.	Bool
	Value	lvarchar (512 characters)	Value of the node.	

Stored Procedures

vw_Configuration_AdvSetting_SystemSetup has no stored procedures.

Column Properties

FullName

Property Name	Value
Description:	The fully qualified name of the node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.FullName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ConfigurationFullName
SQL Data Type/Length:	lvarchar (380 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	512 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedByComponent

Property Name	Value
Description:	The name of the component that last modified this node.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedByComponent
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ComponentName
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Anything goes.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModifiedTime

Property Name	Value
Description:	The date and time of the last modification.
Notes:	This column is updated whenever csp_ConfigurationModify is used to update a node.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.LastModifiedTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxVal

Property Name	Value
Description:	For integer values, the maximum allowed value.
Notes:	NULL indicates there is no maximum set.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MaxVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MinVal

Property Name	Value
Description:	For integer values, the minimum allowed value.
Notes:	NULL indicates there is no minimum specified.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.MinVal
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RegexValidation

Property Name	Value
Description:	For string values, a regular expression string used to validate the string value.
Notes:	NULL indicates there is no regular expression checking for this value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RegexValidation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiresRestart

Property Name	Value
Description:	A flag indicating whether or not CUC will need to be restarted if this setting is changed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.RequiresRestart
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Type

Property Name	Value
Description:	The data type of the node value.
Notes:	Values: 1: The node contains a NULL value. 11: The node contains a bool type value. 3: The node contains a long value. 4: The node contains a float value. 7: The node contains a date/time value. 8: The node contains a string value. 88: The node contains a GUID (unique identifier) value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Configuration.Type
Primary Key:	False
Allow Null:	False

5.59. vw_Contact

A system contact along with its associated alias, dtmfaccessid, and streamfile attributes.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AltFirstName	nvarchar (64 characters)	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	AltLastName	nvarchar (64 characters)	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	CallHandlerObjectId	char (36 characters)	The unique identifier of the primary CallHandler object for the contact.	ObjectID
	DeliveryLocationDtmfAccessId	nvarchar (40 characters)	The dtmf access id for the location to which this object belongs.	DtmfAccessId
	DeliveryLocationObjectId	char (36 characters)	The unique identifier of the location to which this contact's messages will be sent. Currently, this is a LocationVPIM, but in the future as we add other types of interops it could be another type of Location such as LocationOctel or LocationAMIS.	ObjectID
	DirectoryId	lvarchar (2048 characters)	The identifier of a user in a corporate directory (such as Active Directory).	DirectoryId
	DisableOutbound	smallint (2 bytes)	For an AMIS remote contact, indicates no messages are being delivered to this target	Bool
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	DtmfNameFirstLast	varchar (16 characters)	Digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the contact. These digits are used for searching the contact by name via the phone.	DtmfName

Key	Name	SQL Data Type/Length	Description	Custom Type
	DtmfNameLastFirst	varchar (16 characters)	Digits corresponding the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the contact. These digits are used for searching the contact by name via the phone.	DtmfName
	FirstName	nvarchar (64 characters)	The first name (i.e., givenName) of a contact. Not their surname nor middle name.	Name
	LastName	nvarchar (64 characters)	The last name (i.e., surname or family name) of a contact, by which a contact is commonly known.	Name
	ListInDirectory	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should list the contact in the phone directory for outside callers.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this contact belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Contact object.	ObjectID
	RemoteAddress	lvarchar (256 characters)	A mail address on the remote system.	
	TransferEnabled	smallint (2 bytes)	Transfer enabled?	Bool
	TransferExtension	nvarchar (40 characters)	Transfer Extension	PhoneNumber E123
	TransferRings	smallint (2 bytes)	The number of times the extension rings before Cisco Unity Connection considers it a "ring no answer" and plays the subscriber or handler greeting.	
	TransferType	smallint (2 bytes)	The type of call transfer Cisco Unity Connection will perform - supervised or unsupervised (also referred to as "Release to Switch" transfer).	TransferType
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_ContactCreate	Creates a contact representing a user in a remote mail system by inserting a new row into tbl_Contact. In addition to creating a new Contact object, this procedure also creates several Contact related objects: * A DtmfAccessId object by inserting a new row into tbl_DtmfAccessId. * An Alias object is created in the tbl_Alias table by calling csp_AliasCreate. * If the parameter @VoiceName contains a value other than NULL, a StreamFile object is created with the value of tbl_StreamFile.FileName = @VoiceName. If this value is specified, it must be a filename that was allocated using csp_AllocateVoiceFile. If not specified, a filename will be generated.
csp_ContactDelete	Deletes a Contact object from tbl_Contact as specified by the @ObjectId parameter.

Name	Description
csp_ContactModify	Updates the attributes of a Contact object based on the values passed in via the parameters. The @ObjectId parameter identifies the Contact object that is updated.
csp_VirtualContactCreate	Creates a virtual contact representing a VPIM user in a remote mail system by inserting a new row into tbl_Contact. In addition to creating a new Contact object, this procedure also creates an Alias object in the tbl_Alias table by calling csp_AliasCreate.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltFirstName

Property Name	Value
Description:	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.

Property Name	Value
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user firstname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altfirstname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.AltFirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltLastName

Property Name	Value
Description:	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user lastname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altlastname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.AltLastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.

Property Name	Value
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallHandlerObjectId

Property Name	Value
Description:	The unique identifier of the primary CallHandler object for the contact.
Notes:	The call handler determines how calls to the contact are handled, which greeting is played, and what options callers are given during after the greetings.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.CallHandlerObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DeliveryLocationDtmfAccessId

Property Name	Value
Description:	The dtmf access id for the location to which this object belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId

Property Name	Value
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\%\'?\'()\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DeliveryLocationObjectId

Property Name	Value
Description:	The unique identifier of the location to which this contact's messages will be sent. Currently, this is a LocationVPIM, but in the future as we add other types of interops it could be another type of Location such as LocationOctel or LocationAMIS.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DeliveryLocationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DirectoryId

Property Name	Value
Description:	The identifier of a user in a corporate directory (such as Active Directory).
Notes:	Exactly what is stored here changes depending on the directory.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DirectoryId

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId
SQL Data Type/Length:	lvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisableOutbound

Property Name	Value
Description:	For an AMIS remote contact, indicates no messages are being delivered to this target
Notes:	If an AMIS remote contact is configured to deliver messages to a target that is not answering or does not indicate its an AMIS destination or the like, deliveries will fail. If they fail too many times or for specific reasons, Unity will terminate delivery attempts as per the AMIS specification. If that happens, this value is set to 1.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DisableOutbound
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	The rule for automatically generating the displayname uses the Contact "FirstName" and "LastName" columns.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ %\?\"'()~\!]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameFirstLast

Property Name	Value
Description:	Digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the contact. These digits are used for searching the contact by name via the phone.
Notes:	The digits corresponding to the contact first name are first, followed by the digits corresponding to the contact last name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of either the contact first or last name columns. For example, if a contact name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 8424282733427439
Business Rules:	When the first or last name of the contact is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DtmfNameFirstLast
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameLastFirst

Property Name	Value
Description:	Digits corresponding the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the contact. These digits are used for searching the contact by name via the phone.
Notes:	The digits corresponding to the contact last name are first, followed by the digits corresponding to the contact first name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of the contact last or first name columns. For example, if a contact name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 4274392842428273
Business Rules:	When the last name of the contact is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DtmfNameLastFirst

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FirstName

Property Name	Value
Description:	The first name (i.e., givenName) of a contact. Not their surname nor middle name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.FirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastName

Property Name	Value
Description:	The last name (i.e., surname or family name) of a contact, by which a contact is commonly known.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.LastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ListInDirectory

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should list the contact in the phone directory for outside callers.
Notes:	<p>If the contact is listed in the phone directory AND has a recorded voice name, outside callers can find this contact by spelling their name when using a directory handler (NameLookupHandler). This value has no effect on other users addressing this contact by name.</p> <p>Values: 0: Do not list the contact in the phone directory. 1: List the contact in the phone directory.</p>
Business Rules:	
Developer Notes:	Does this need to be set for GUI and TUI separately?
Table/Column Mapping:	tbl_Contact.ListInDirectory
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this contact belongs.
Notes:	
Business Rules:	
Developer Notes:	This will always be the local VMS until we are using LocationVMS to partition the local directory.
Table/Column Mapping:	tbl_Contact.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Contact object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Contact.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RemoteAddress

Property Name	Value
Description:	A mail address on the remote system.
Notes:	This address isn't an SMTP address necessarily, for example on AMIS it is a remote extension.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.RemoteAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferEnabled

Property Name	Value
Description:	Transfer enabled?
Notes:	Maps to alternate transfer option's transfer action.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferExtension

Property Name	Value
Description:	Transfer Extension
Notes:	Maps to alternate transfer option's transfer extension.
Business Rules:	<ol style="list-style-type: none"> 1. The default value is the DtmfAccessId of the call handler to which this transfer rule belongs. 2. The valid characters for the extension are digits 0-9, T and t (indicates tone dialing), comma (indicating a pause - not supported if integration is SIP), asterisk (*) and hash (#) characters. This is for backwards compatibility with Unity 4.x.
Developer Notes:	
Table/Column Mapping:	tbl_TransferOption.Extension
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferRings

Property Name	Value
Description:	The number of times the extension rings before Cisco Unity Connection considers it a "ring no answer" and plays the subscriber or handler greeting.
Notes:	Applies only when the value of the TransferType column is set to "Supervised" (1).

Property Name	Value
Business Rules:	The value of this column should never be less than 2 for a supervised transfer.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.TransferRings
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	2
Validation - Maximum Value:	100

TransferType

Property Name	Value
Description:	The type of call transfer Cisco Unity Connection will perform - supervised or unsupervised (also referred to as "Release to Switch" transfer).
Notes:	Values: 0: Unsupervised (release) transfer - just let the switch do the transfer, and do not stay on the line and take action on RNA or busy. 1: Supervised transfer - listen for busy, ring no answer.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.TransferType
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	TransferType
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.60. vw_Conversation

A subscriber or routable conversation and its localized name based on the language code.

Additional Information

This view is comprised of all the columns in the tbl_Conversation, plus an additional column - LocalizedName - that is defined in the tbl_LocalizedText table.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CnvCallHandlerAfter-Greeting	smallint (2 bytes)	A flag indicating whether the conversation can be the destination for a call, after a greeting is played. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.	Bool
	CnvCallHandlerAfter-Message	smallint (2 bytes)	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for the call handler. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.	Bool
	CnvCallHandlerCallerInput	smallint (2 bytes)	A flag indicating whether the conversation can be assigned to user input keys for a call handler greeting. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.	Bool
	CnvDirectoryHandler-Exit	smallint (2 bytes)	A flag indicating whether the conversation can be a destination from a directory handler when the caller presses * to exit.	Bool
	CnvDirectoryHandler-NoInput	smallint (2 bytes)	A flag indicating whether the conversation can be a destination from a directory handler when the caller does not respond to the name entry prompt.	Bool
	CnvDirectoryHandler-NoSelection	smallint (2 bytes)	A flag indicating whether the conversation can be a destination from a directory handler when the caller enters a name but does not select an item from the resulting match list, or when the Play All Names is enabled and the caller does not respond to prompts.	Bool
	CnvDirectoryHandler-ZeroExit	smallint (2 bytes)	A flag indicating whether the conversation can be a destination from a directory handler when the caller presses the zero ("0") key.	Bool
	CnvInterviewHandler-AfterMessage	smallint (2 bytes)	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for the interview handler.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	CnvRoutingRuleDirect-Call	smallint (2 bytes)	A flag indicating whether the conversation can be a destination in a call routing rule for a direct call.	Bool
	CnvRoutingRuleForwardedCall	smallint (2 bytes)	A flag indicating whether the conversation can be a destination in a call routing rule for a forwarded call.	Bool
	CnvSubscriberAfter-Greeting	smallint (2 bytes)	A flag indicating whether the conversation can be the destination for a call, after a subscriber greeting is played.	Bool
	CnvSubscriberAfterMessage	smallint (2 bytes)	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for a subscriber.	Bool
	CnvSubscriberCallerInput	smallint (2 bytes)	A flag indicating whether the conversation can be assigned to user input keys for a subscriber greeting.	Bool
	CnvSubscriberExit	smallint (2 bytes)	A flag indicating whether the conversation can be the destination when exiting a subscriber conversation.	Bool
	CnvSubscriberMainConv	smallint (2 bytes)	A flag indicating whether the conversation can be used as a subscriber main conversation.	Bool
PK	ConversationName	nvarchar (64 characters)	The name of the conversation that can be used to identify a conversation. A subscriber uses this for message retrieval, sending, and setup; or the target of a call routing rule.	Conversation-Name
	IsVui	smallint (2 bytes)	A flag indicating whether the conversation is a VUI conversation.	Bool
PK	LanguageCode	int (4 bytes)	The language code (LCID) indicating the language of the text in the LocalizedName column.	Language-Code
	LocalizedName	lvarchar (1024 characters)	The localized name of the conversation, which is displayed in the SA.	
	RequiresCallHandler	smallint (2 bytes)	A flag indicating whether a call handler object is required as input to the conversation.	Bool
	RequiresDirectoryHandler	smallint (2 bytes)	A flag indicating whether a directory handler object is required as input to the conversation.	Bool
	RequiresInterviewHandler	smallint (2 bytes)	A flag indicating whether an interview handler object is required as input to the conversation.	Bool
	RequiresSubscriber	smallint (2 bytes)	A flag indicating whether a subscriber object is required as input to the conversation.	Bool
	TextName	varchar (192 characters)	Localization key used to lookup the localized name in tbl_LocalizedText.	

Stored Procedures

vw_Conversation has no stored procedures.

Column Properties

CnvCallHandlerAfterGreeting

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination for a call, after a greeting is played. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.
Notes:	Values: 0: The conversation cannot be a destination for after a greeting is played. 1: The conversation can be a destination for after a greeting is played.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvCallHandlerAfterGreeting
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvCallHandlerAfterMessage

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for the call handler. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.
Notes:	Values: 0: The conversation cannot be the destination for a call after a caller leaves a message for a call handler. 1: The conversation can be the destination for a call after a caller leaves a message for a call handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvCallHandlerAfterMessage
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvCallHandlerCallerInput

Property Name	Value
Description:	A flag indicating whether the conversation can be assigned to user input keys for a call handler greeting. This flag applies to "application" call handlers, not primary call handlers belonging to a subscriber.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvCallHandlerCallerInput
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvDirectoryHandlerExit

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination from a directory handler when the caller presses * to exit.

Property Name	Value
Notes:	Values: 0: The conversation cannot be the destination for a call when a caller presses * to exit a directory handler. 1: The conversation can be the destination for a call when a caller presses * to exit a directory handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvDirectoryHandlerExit
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvDirectoryHandlerNoInput

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination from a directory handler when the caller does not respond to the name entry prompt.
Notes:	Values: 0: The conversation cannot be the destination for a call when the caller does not respond to the name entry prompt for a directory handler. 1: The conversation can be the destination for a call when the caller does not respond to the name entry prompt for a directory handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvDirectoryHandlerNoInput
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvDirectoryHandlerNoSelection

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination from a directory handler when the caller enters a name but does not select an item from the resulting match list, or when the Play All Names is enabled and the caller does not respond to prompts.
Notes:	Values: 0: The conversation cannot be the destination for a call from a directory handler when the caller does not make a selection to a matching name. 1: The conversation can be the destination for a call from a directory handler when the caller does not make a selection to a matching name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvDirectoryHandlerNoSelection
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvDirectoryHandlerZeroExit

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination from a directory handler when the caller presses the zero ("0") key.
Notes:	Values: 0: The conversation cannot be the destination for a call when a caller presses zero to exit a directory handler. 1: The conversation can be the destination for a call when a caller presses zero to exit a directory handler.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvDirectoryHandlerZeroExit
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvInterviewHandlerAfterMessage

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for the interview handler.
Notes:	Values: 0: The conversation cannot be the destination for a call after a caller leaves a message for a interview handler. 1: The conversation can be the destination for a call after a caller leaves a message for a interview handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvInterviewHandlerAfterMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvRoutingRuleDirectCall

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination in a call routing rule for a direct call.
Notes:	Values: 0: The conversation cannot be a destination in a call routing rule for a direct call. 1: The conversation can be a destination in a call routing rule for a direct call.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvRoutingRuleDirectCall
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvRoutingRuleForwardedCall

Property Name	Value
Description:	A flag indicating whether the conversation can be a destination in a call routing rule for a forwarded call.
Notes:	Values: 0: The conversation cannot be a destination in a call routing rule for a forwarded call. 1: The conversation can be a destination in a call routing rule for a forwarded call.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvRoutingRuleForwardedCall
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvSubscriberAfterGreeting

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination for a call, after a subscriber greeting is played.
Notes:	Values: 0: The conversation cannot be a destination for after a subscriber greeting is played. 1: The conversation can be a destination for after a subscriber greeting is played.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvSubscriberAfterGreeting
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvSubscriberAfterMessage

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination for a call after a caller leaves a message for a subscriber.
Notes:	Values: 0: The conversation cannot be the destination for a call after a caller leaves a message for a subscriber. 1: The conversation can be the destination for a call after a caller leaves a message for a subscriber.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvSubscriberAfterMessage

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvSubscriberCallerInput

Property Name	Value
Description:	A flag indicating whether the conversation can be assigned to user input keys for a subscriber greeting.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvSubscriberCallerInput
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:

Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvSubscriberExit

Property Name	Value
Description:	A flag indicating whether the conversation can be the destination when exiting a subscriber conversation.

Property Name	Value
Notes:	Values: 0: The conversation cannot be used as an exit destination from a subscriber conversation. 1: The conversation can be used as an exit destination from a subscriber conversation.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvSubscriberExit
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CnvSubscriberMainConv

Property Name	Value
Description:	A flag indicating whether the conversation can be used as a subscriber main conversation.
Notes:	Values: 0: The conversation cannot be used as a subscriber main conversation. 1: The conversation can be used as a subscriber main conversation.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.CnvSubscriberMainConv
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationName

Property Name	Value
Description:	The name of the conversation that can be used to identify a conversation. A subscriber uses this for message retrieval, sending, and setup; or the target of a call routing rule.
Notes:	Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity 4.0(4), valid values of subscriber conversations for the ConversationName column were: <ul style="list-style-type: none"> * SubMenu - Standard Cisco Unity Connection subscriber conversation. * SubMenuOpt1 - The "optional conversation 1." * ConvHotel - Special hotel guest conversation that can used with the "Bellhop" package. * ConvCVM - Special conversation for the Community Voice Mail project. Not used in normal Cisco Unity Connection deployments.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.ConversationName
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsVui

Property Name	Value
Description:	A flag indicating whether the conversation is a VUI conversation.
Notes:	Values: 0: Not a VUI conversation 1: Is a VUI conversation
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Conversation.IsVui
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LanguageCode

Property Name	Value
Description:	The language code (LCID) indicating the language of the text in the LocalizedName column.

Property Name	Value
Notes:	<p>You need to include "WHERE LanguageCode=1033" or such to get the LocalizedName for the desired language from tbl_LocalizedText.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241</p> <p>10249: English_Belize 10249</p> <p>1025: Arabic_Saudi_Arabia 1025</p> <p>10250: Spanish_Peru 10250</p> <p>1026: Bulgarian 1026</p> <p>1027: Catalan 1027</p> <p>1028: Chinese_Taiwan 1028</p> <p>1029: Czech 1029</p> <p>1030: Danish 1030</p> <p>1031: German_Standard 1031</p> <p>1032: Greek 1032</p> <p>1033: English_United_States 1033</p> <p>1034: Spanish_Traditional_Sort 1034</p> <p>1035: Finnish 1035</p> <p>1036: French_Standard 1036</p> <p>1037: Hebrew 1037</p> <p>1038: Hungarian 1038</p> <p>1039: Icelandic 1039</p> <p>1040: Italian_Standard 1040</p> <p>1041: Japanese 1041</p> <p>1042: Korean 1042</p> <p>1043: Dutch_Standard 1043</p> <p>1044: Norwegian_Bokmal 1044</p> <p>1045: Polish 1045</p> <p>1046: Portuguese_Brazilian 1046</p> <p>1047: Rhaeto-Romanic 1047</p> <p>1048: Romanian 1048</p> <p>1049: Russian 1049</p> <p>1050: Croatian 1050</p> <p>1051: Slovak 1051</p> <p>1052: Albanian 1052</p> <p>1053: Swedish 1053</p> <p>1054: Thai 1054</p> <p>1055: Turkish 1055</p> <p>1056: Urdu 1056</p> <p>1057: Indonesian 1057</p> <p>1058: Ukrainian 1058</p> <p>1059: Belarusian 1059</p> <p>1060: Slovenian 1060</p> <p>1061: Estonian 1061</p> <p>1062: Latvian 1062</p> <p>1063: Lithuanian 1063</p> <p>1065: Farsi 1065</p> <p>1066: Vietnamese 1066</p> <p>1067: Armenian 1067</p> <p>1068: Azeri_Latin 1068</p> <p>1069: Basque 1069</p> <p>1070: Sorbian 1070</p> <p>1071: Macedonian 1071</p> <p>1072: Sutu 1072</p> <p>1073: Tsonga 1073</p>

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AccessAdvancedUser	smallint (2 bytes)	Duplicate of AdvnacedUserFeatures for licensing code purposes.	Bool
	AccessAdvancedUser-Features	smallint (2 bytes)	A flag indicating whether or not the subscriber has access to advanced user features. Currently, there are two advanced user features: TTS and VUI.	Bool
	AccessCallRoutingRules	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can access personal call routing rules.	Bool
	AccessFaxMail	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS is allowed to manage their fax messages over the phone or from the Cisco Unity Connection Inbox.	Bool
	AccessIMAP	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can access VM via an IMAP client.	Bool
	AccessLiveReply	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can after listening to a message from another subscriber press 4-4, and Cisco Unity Connection will call the subscriber who left the message. Generally referred to as "Live Reply."	Bool
	AccessTts	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can have to their e-mail messages read to them by an e-mail reader over the phone.	Bool
	AccessUnifiedClient	smallint (2 bytes)	A flag indicating whether a subscriber can use the unified client.	Bool
	AccessVmi	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can use the Cisco Unity Connection Inbox to listen to, compose, reply to, forward, and delete voice messages. If the subscriber has "AccessFaxMail" set, they can also use it to manage their faxes. This is a licensed feature.	Bool
	AccessVui	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can use the voice driven inbox conversation.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallHoldAvailable	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to change their own call holding options by using the Cisco Unity Connection Assistant. Call holding settings apply when calls are transferred from the automated attendant or a directory handler to subscriber phones. They do not apply when an outsider caller or another subscriber dials a subscriber extension directly.	Bool
	CallScreenAvailable	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to change their own call screening options by using the Cisco Unity Assistant. Call screening settings apply when calls are transferred from the automated attendant or a directory handler to subscriber phones. They do not apply when an outsider caller or another subscriber dials a subscriber extension directly.	Bool
	CanRecordName	smallint (2 bytes)	A flag indicating whether the subscriber can record their own name.	Bool
	CanSendToPublicDI	smallint (2 bytes)	A flag indicating whether the subscriber can send messages to system (formerly called "public") distribution lists.	Bool
	DisplayName	nvarchar (64 characters)	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	EnableEnhancedSecurity	smallint (2 bytes)	A flag indicating whether the subscriber uses regular or enhanced phone security. Enhanced phone security adds RSA two-factor authentication to regular security.	Bool
	FaxRestrictionObjectId	char (36 characters)	The unique identifier for the RestrictionTable object that Cisco Unity Connection uses to limit phone numbers that the subscriber can enter in fax dialing settings.	ObjectID
	ImapCanFetchMessage-Body	smallint (2 bytes)	A flag indicating whether the subscriber can fetch the body of a non-private message using IMAP.	Bool
	ImapCan-FetchPrivateMessage-Body	smallint (2 bytes)	A flag indicating whether the subscriber can fetch the body of a private message using IMAP.	Bool
	ListInDirectoryStatus	smallint (2 bytes)	A flag indicating whether subscribers can choose to be listed or not in the phone directory. The phone directory (directory assistance) is the audio listing that subscribers and unidentified callers use to reach subscribers and to leave messages.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS to which this COS belongs.	ObjectID
	MaxGreetingLength	int (4 bytes)	The maximum recording length (in seconds) allowed to the subscriber for recording their greeting.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxMembersPVL	int (4 bytes)	The maximum number of members allowed in a personal voice mail list.	
	MaxMsgLength	int (4 bytes)	The maximum recording length (in seconds) allowed to the subscriber for recording messages and conversations.	
	MaxNameLength	int (4 bytes)	The maximum recording length (in seconds) allowed to the subscriber for recording their voice name.	
	MaxPrivateDlists	smallint (2 bytes)	The maximum number of personal voice mail lists the subscriber is allowed to create.	
	MovetoDeleteFolder	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection moves deleted messages for the subscriber to a Deleted Items folder or physically deletes the message. True='deletion' moves messages to the DeletedItems folder, where it ages until it evaporates. False='deletion' physically deletes the message	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a COS object.	ObjectID
	OutcallRestrictionObjectId	char (36 characters)	The unique identifier of the RestrictionTable object that Cisco Unity Connection uses to limit phone numbers that the subscriber can enter in message delivery settings. The restriction table also restricts the subscriber extensions that Cisco Unity Connection dials when the phone is selected as the recording and playback device for the Media Master.	ObjectID
	PersonalAdministrator	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection allows a subscriber to use the Cisco Unity Assistant to personalize their Cisco Unity Connection setting -- including their recorded greetings and message delivery options -- or to set up message notification devices and create private lists.	Bool
	ReadOnly	smallint (2 bytes)	A flag indicating that this COS is read only. It cannot be modified from the SA.	Bool
	RequireSecureMessages	int (4 bytes)	Specifies when to mark message secure	RequireSecureMessages
	SendBroadcastMessage	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to send broadcast messages to all subscribers on the VMS.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	UaAlternateExtension-Access	smallint (2 bytes)	The abilities a subscriber has to manage administer-defined alternate extensions assigned to the subscriber. Determines whether subscribers can view the administrator-defined alternate extensions, and whether subscribers can manage (add, modify, and delete) their own set of alternate extensions in the Cisco Unity Assistant. If enabled, subscribers can define up to 5 alternate extensions in addition to the 9 alternate extensions that an administrator can define for them.	UaAl-ternateExtension
	Undeleteable	smallint (2 bytes)	A flag indicating whether this COS can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UpdateBroadcastMessage	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to update broadcast messages that are active or will be active in the future.	Bool
	WarnIntervalMsgEnd	int (4 bytes)	The amount of time (in milliseconds) before the end of the maximum recording time when Cisco Unity Connection will play a warning tone or WAV file to indicate to the caller that they are almost out of recording time.	
	WarnMinMsgLength	int (4 bytes)	The minimum length (in milliseconds) that the maximum recording time has to be before the record termination warning feature is active. When the record termination feature is active, Cisco Unity Connection plays a warning tone indicating to the caller that they are almost out of recording time.	
	XferRestrictionObjectId	char (36 characters)	The unique identifier of the RestrictionTable object that Cisco Unity Connection uses to limit phone numbers that the subscriber can enter in call transfer settings.	ObjectID

Stored Procedures

Name	Description
csp_CosCreate	Creates a collection of service privileges (Class Of Service) for subscribers that control access to features and use of the system by inserting a new row into tbl_COS.
csp_CosDelete	Deletes a COS object from tbl_Cos as specified by the @ObjectId parameter.
csp_CosModify	Updates the attributes of a COS object based on the values passed in via the parameters. The @ObjectId parameter identifies the COS object that is updated.

Column Properties

AccessAdvancedUser

Property Name	Value
Description:	Duplicate of AdvnacedUserFeatures for licensing code purposes.
Notes:	Values: 0: The Subscriber can not access advanced user features. 1: The Subscriber can access advanced user features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessAdvancedUserFeatures
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessAdvancedUserFeatures

Property Name	Value
Description:	A flag indicating whether or not the subscriber has access to advanced user features. Currently, there are two advanced user features: TTS and VUI.
Notes:	Values: 0: The Subscriber can not access advanced user features. 1: The Subscriber can access advanced user features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessAdvancedUserFeatures
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessCallRoutingRules

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can access personal call routing rules.
Notes:	Values: 0: Cannot access to Personal Call Routing rules 1: Can access to Personal Call Routing rules
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessCallRoutingRules
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessFaxMail

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS is allowed to manage their fax messages over the phone or from the Cisco Unity Connection Inbox.

Property Name	Value
Notes:	<p>Future feature, 3rd-party fax is not supported in Cisco Unity Connection.</p> <p>Values: 0: Do not allow access to fax mail 1: Allow access to fax mail</p> <p>To allow subscribers to have their e-mail messages delivered to a fax machine, both this column and "AccessTts" must be set to "1."</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessFaxMail
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessIMAP

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can access VM via an IMAP client.
Notes:	<p>Values: 0: Cannot access voice mail via IMAP 1: Can access voice mail via IMAP</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessIMAP
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessLiveReply

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can after listening to a message from another subscriber press 4-4, and Cisco Unity Connection will call the subscriber who left the message. Generally referred to as "Live Reply."
Notes:	Values: 0: Cannot "live reply" to another subscriber 1: Can "live reply" to another subscriber after listening to message from another subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessLiveReply
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessTts

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can have to their e-mail messages read to them by an e-mail reader over the phone.
Notes:	Values: 0: Cannot have e-mail messages read over the phone 1: Can have e-mail messages read over the phone To allow subscribers to have their e-mail messages delivered to a fax machine, both this column and "AccessFaxMail" must be set to "1."
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessTts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessUnifiedClient

Property Name	Value
Description:	A flag indicating whether a subscriber can use the unified client.
Notes:	Values:0: Cannot access voice mail using unified client 1: Can access voice mail using unified client
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessUnifiedClient
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessVmi

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can use the Cisco Unity Connection Inbox to listen to, compose, reply to, forward, and delete voice messages. If the subscriber has "AccessFaxMail" set, they can also use it to manage their faxes. This is a licensed feature.
Notes:	Values: 0: Cannot use Cisco Unity Connection Inbox 1: Can use Cisco Unity Connection Inbox
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessVmi
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AccessVui

Property Name	Value
Description:	A flag indicating whether a subscriber assigned this COS can use the voice driven inbox conversation.
Notes:	Values: 0: Cannot use the voice driven inbox conversation 1: Can use the voice driven inbox conversation
Business Rules:	
Developer Notes:	This needs to show up in the Features page of COS in the SA. This will likely be visible/hidden in the COS on the SA based on if ASR is licensed or not - we're still running that down.
Table/Column Mapping:	tbl_Cos.AccessVui
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CallHoldAvailable

Property Name	Value
Description:	A flag indicating whether the subscriber has the ability to change their own call holding options by using the Cisco Unity Connection Assistant. Call holding settings apply when calls are transferred from the automated attendant or a directory handler to subscriber phones. They do not apply when an outsider caller or another subscriber dials a subscriber extension directly.
Notes:	Values: 0: Cannot change call holding settings via Cisco Unity Assistant 1- Can change call holding settings via Cisco Unity Assistant
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.CallHoldAvailable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CallScreenAvailable

Property Name	Value
Description:	A flag indicating whether the subscriber has the ability to change their own call screening options by using the Cisco Unity Assistant. Call screening settings apply when calls are transferred from the automated attendant or a directory handler to subscriber phones. They do not apply when an outsider caller or another subscriber dials a subscriber extension directly.

Property Name	Value
Notes:	Values: 0: Cannot change call screening settings via Cisco Unity Assistant 1- Can change call screening settings via Cisco Unity Assistant
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.CallScreenAvailable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CanRecordName

Property Name	Value
Description:	A flag indicating whether the subscriber can record their own name.
Notes:	Used to prevent subscribers from recording their own names (for example, if an organization has all names and greetings recorded in one voice). Values: 0: Cannot record their name 1: Can record their name
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.CanRecordName
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

CanSendToPublicDI

Property Name	Value
Description:	A flag indicating whether the subscriber can send messages to system (formerly called "public") distribution lists.
Notes:	Values: 0: Cannot send messages to system distribution lists 1: Can send messages to system distribution lists
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.CanSendToPublicDI
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	DisplayName is a required when creating a new COS.
Developer Notes:	
Table/Column Mapping:	tbl_Cos.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName

Property Name	Value
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableEnhancedSecurity

Property Name	Value
Description:	A flag indicating whether the subscriber uses regular or enhanced phone security. Enhanced phone security adds RSA two-factor authentication to regular security.
Notes:	Values: 0: Regular security 1: Enhanced phone security (RSA two-factor security)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.EnableEnhancedSecurity
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

FaxRestrictionObjectId

Property Name	Value
Description:	The unique identifier for the RestrictionTable object that Cisco Unity Connection uses to limit phone numbers that the subscriber can enter in fax dialing settings.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_Cos.FaxRestrictionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ImapCanFetchMessageBody

Property Name	Value
Description:	A flag indicating whether the subscriber can fetch the body of a non-private message using IMAP.
Notes:	Values: 0: Cannot fetch message body of non-private messages. 1: Using IMAP, subscriber can fetch message body of non-private messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ImapCanFetchMessageBody
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ImapCanFetchPrivateMessageBody

Property Name	Value
Description:	A flag indicating whether the subscriber can fetch the body of a private message using IMAP.
Notes:	Values: 0: Cannot fetch message body of private messages. 1: Using IMAP, subscriber can fetch message body of private messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ImapCanFetchPrivateMessageBody
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ListInDirectoryStatus

Property Name	Value
Description:	A flag indicating whether subscribers can choose to be listed or not in the phone directory. The phone directory (directory assistance) is the audio listing that subscribers and unidentified callers use to reach subscribers and to leave messages.
Notes:	Values: 0: Cannot choose whether or not to be listed in phone directory 1: Can choose whether or not to be listed in phone directory
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ListInDirectoryStatus
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS to which this COS belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxGreetingLength

Property Name	Value
Description:	The maximum recording length (in seconds) allowed to the subscriber for recording their greeting.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MaxGreetingLength
Primary Key:	False
Allow Null:	False
Default Value:	90
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

MaxMembersPVL

Property Name	Value
Description:	The maximum number of members allowed in a personal voice mail list.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MaxMembersPVL
Primary Key:	False
Allow Null:	False
Default Value:	99
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	999

MaxMsgLength

Property Name	Value
Description:	The maximum recording length (in seconds) allowed to the subscriber for recording messages and conversations.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MaxMsgLength
Primary Key:	False
Allow Null:	False
Default Value:	300

Property Name	Value
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	3600

MaxNameLength

Property Name	Value
Description:	The maximum recording length (in seconds) allowed to the subscriber for recording their voice name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MaxNameLength
Primary Key:	False
Allow Null:	False
Default Value:	30
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

MaxPrivateDlists

Property Name	Value
Description:	The maximum number of personal voice mail lists the subscriber is allowed to create.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MaxPrivateDlists

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	25
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

MovetoDeleteFolder

Property Name	Value
Description:	<p>A flag indicating whether Cisco Unity Connection moves deleted messages for the subscriber to a Deleted Items folder or physically deletes the message.</p> <p>True='deletion' moves messages to the DeletedItems folder, where it ages until it evaporates. False='deletion' physically deletes the message</p>
Notes:	<p>When this column is set to "1," a subscriber can:</p> <ul style="list-style-type: none"> * Use the phone and the Cisco Unity Connection Inbox (as applicable) to permanently delete messages stored in their Deleted Items folder. * Use the phone and the Cisco Unity Connection Inbox to listen to, reply to, or forward messages in their Deleted Items folder, or to restore them to the Inbox. <p>Values: 0: Deleted messages are not moved to a Deleted Items folder, rather they are permanently deleted. 1: Deleted messages are moved to a Deleted Items folder.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.MovetoDeleteFolder
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a COS object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OutcallRestrictionObjectId

Property Name	Value
Description:	The unique identifier of the RestrictionTable object that Cisco Unity Connection uses to limit phone numbers that the subscriber can enter in message delivery settings. The restriction table also restricts the subscriber extensions that Cisco Unity Connection dials when the phone is selected as the recording and playback device for the Media Master.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.OutcallRestrictionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalAdministrator

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection allows a subscriber to use the Cisco Unity Assistant to personalize their Cisco Unity Connection setting -- including their recorded greetings and message delivery options -- or to set up message notification devices and create private lists.
Notes:	Values: 0: Cannot use Cisco Unity Assistant 1: Can use Cisco Unity Assistant
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.PersonalAdministrator
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ReadOnly

Property Name	Value
Description:	A flag indicating that this COS is read only. It cannot be modified from the SA.

Property Name	Value
Notes:	Values: 0: Can modify this COS. 1: Cannot modify this COS.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ReadOnly
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RequireSecureMessages

Property Name	Value
Description:	Specifies when to mark message secure
Notes:	Values: 1: Always mark secure 2: Never mark secure 3: Ask 4: Set private messages secure
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.RequireSecureMessages
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	RequireSecureMessages
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

SendBroadcastMessage

Property Name	Value
Description:	A flag indicating whether the subscriber has the ability to send broadcast messages to all subscribers on the VMS.
Notes:	Values: 0: Cannot send broadcast messages. 1: Can send broadcast messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.SendBroadcastMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UaAlternateExtensionAccess

Property Name	Value
Description:	The abilities a subscriber has to manage administer-defined alternate extensions assigned to the subscriber. Determines whether subscribers can view the administrator-defined alternate extensions, and whether subscribers can manage (add, modify, and delete) their own set of alternate extensions in the Cisco Unity Assistant. If enabled, subscribers can define up to 5 alternate extensions in addition to the 9 alternate extensions that an administrator can define for them.

Property Name	Value
Notes:	Values: 0: No access - subscriber cannot view or manage alternate extensions. 1: Read access - subscriber can view administrator-defined alternate extensions. 2: CUD access - subscriber can manage (create, modify, and delete) their own subscriber-defined alternate extensions. 3: CRUD access - subscriber can view administrator-defined alternate extensions and manage (create, modify, and delete) their own subscriber-defined alternate extensions.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.UaAlternateExtensionAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	UaAlternateExtension
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this COS can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Values: 0: COS cannot be deleted using Cisco Unity Connection Administration 1: COS can be deleted using Cisco Unity Connection Administration
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UpdateBroadcastMessage

Property Name	Value
Description:	A flag indicating whether the subscriber has the ability to update broadcast messages that are active or will be active in the future.
Notes:	Values: 0: Cannot update broadcast messages. 1: Can update broadcast messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.UpdateBroadcastMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WarnIntervalMsgEnd

Property Name	Value
Description:	The amount of time (in milliseconds) before the end of the maximum recording time when Cisco Unity Connection will play a warning tone or WAV file to indicate to the caller that they are almost out of recording time.

Property Name	Value
Notes:	<p>This column works together with "WarnMinMsgLength" enabling the record termination warning feature. If the feature is enabled by the settings of these two columns, callers will hear a warning tone sound before the maximum message length is reached.</p> <p>Call termination warning only works with the Unified Communications Manager integration.</p> <p>Values: 0: Record termination warning disabled 1-60000: The number of milliseconds from the end of the maximum recording time when the record termination warning tone is played.</p>
Business Rules:	
Developer Notes:	This is currently a system-wide registry setting that can be changed using the "Advanced Setting Tool." To meet accessibility requirements in Cisco Unity Connection, this setting must be able to be applied to a group of subscribers as well as per subscriber.
Table/Column Mapping:	tbl_Cos.WarnIntervalMsgEnd
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	30000

WarnMinMsgLength

Property Name	Value
Description:	The minimum length (in milliseconds) that the maximum recording time has to be before the record termination warning feature is active. When the record termination feature is active, Cisco Unity Connection plays a warning tone indicating to the caller that they are almost out of recording time.

Property Name	Value
Notes:	<p>This column works together with "WarnIntervalMsgEnd" enabling the record termination warning feature. If the feature is enabled by the settings of these two columns, callers will hear a warning tone sound before the maximum message length is reached.</p> <p>For instance, if the maximum recording time for a message is set to 30 seconds, you wouldn't want the record termination warning playing after only 10 seconds (or 20 seconds before the limit of 30 seconds).</p> <p>Call termination warning only works with the Unified Communications Manager integration.</p> <p>Values: 0: Record termination warning disabled 1-60000: The number of milliseconds from the end of the maximum recording time when the record termination warning tone is played.</p>
Business Rules:	
Developer Notes:	This is currently a system-wide registry setting that can be changed using the "Advanced Setting Tool." To meet accessibility requirements in Cisco Unity Connection, this setting must be able to be applied to a group of subscribers as well as per subscriber.
Table/Column Mapping:	tbl_Cos.WarnMinMsgLength

5.62. vw_Cos_Licensed

A feature for a subscriber that are under license control.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AccessAdvancedUserFeatures	smallint (2 bytes)	A flag indicating whether or not the subscriber has access to advanced user features. Currently, there are two advanced user features: TTS and VUI.	Bool
	AccessIMAP	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can access VM via an IMAP client.	Bool
	AccessVmi	smallint (2 bytes)	A flag indicating whether a subscriber assigned this COS can use the Cisco Unity Connection Inbox to listen to, compose, reply to, forward, and delete voice messages. If the subscriber has "AccessFaxMail" set, they can also use it to manage their faxes. This is a licensed feature.	Bool
	DisplayName	nvarchar (64 characters)	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a COS object.	ObjectID

Stored Procedures

vw_Cos_Licensed has no stored procedures.

Column Properties

AccessAdvancedUserFeatures

Property Name	Value
Description:	A flag indicating whether or not the subscriber has access to advanced user features. Currently, there are two advanced user features: TTS and VUI.

Property Name	Value
Notes:	Values: 0: The Subscriber can not access advanced user features. 1: The Subscriber can access advanced user features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Cos.AccessAdvancedUserFeatures
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:

Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	DisplayName is a required when creating a new COS.
Developer Notes:	
Table/Column Mapping:	tbl_Cos.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a COS object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Cos.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.63. vw_Cos_List

The basic attributes of a COS used for retrieving a list of COSes.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a COS object.	ObjectID

Stored Procedures

vw_Cos_List has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The unique text name of this COS , e.g. "Default COS," "Basic Voice Mail." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	DisplayName is a required when creating a new COS.
Developer Notes:

Validation - Minimum Value:	
Validation - Maximum Value:	

5.64. vw_Credential

A credential (password or PIN) used for authenticating users to enable access to the system via the phone or a GUI client such as the Cisco Unity Connection Administration or Cisco Personal Assistant (CPCA).

Additional Information

This view is comprised of all the columns in the tbl_Credential table, plus an additional column - Alias - this is defined in the tbl_User table. If a user account in tbl_User is identified as a template, it will not be included in the view.

Users may have multiple sets of credentials. For example, a user may have one set of credentials for performing administrative tasks and another set of credentials to access their voice mail subscription.

This view contains a mapping of credentials with a unique user ID on the local VMS. When a user attempts to gain access to the system whether via the phone client or a GUI client such as CPCA or Cisco Unity Connection Administration, a search is made of the table for the ID. If no user object is found, or the credentials entered don't match those in the view, the user is denied entry. Every user on the system will have an entry in this view regardless of if they have a voice mail subscription, or an administrative role. Please note that Remote Contacts (a directory object that represents a mailbox on a foreign voice messaging system) is not a user since they do not receive messages on the Cisco Unity Connection voice messaging system.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	CantChange	smallint (2 bytes)	A flag indicating whether the user can set this credential.	Bool
	CredentialPolicyObjectId	char (36 characters)	The unique identifier of the CredentialPolicy object that is associated with this credential.	ObjectID
	Credentials	varchar (254 characters)	The PIN or password, for a user. The credentials are stored in an encrypted format.	Credentials
PK	CredentialType	int (4 bytes)	The type of credential such as password, PIN, Windows or Domino credential.	Credential-Type
	CredMustChange	smallint (2 bytes)	A flag indicating whether the user must change their credentials (PIN or password) at the next login.	Bool
	DoesntExpire	smallint (2 bytes)	A flag indicating whether this user credential will expire, and therefore the user must change the credential periodically. However, if the credential does not expire (value = "1"), the user still may change the credential (if allowed by CantChange).	Bool
	EncryptionType	int (4 bytes)	Type of encryption that was used to generate the credentials.	Encryption-Type

Key	Name	SQL Data Type/Length	Description	Custom Type
	HackCount	int (4 bytes)	The number of logons attempted that failed due to invalid credentials. The Unity system or external authentication provider determined that the credentials supplied as part of a user logon attempt were invalid.	
	Hacked	smallint (2 bytes)	A flag indicating whether access to the user account associated with this set of credentials is locked due too many hack attempts.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this credential is mapped to the user NT/AD domain account and as such is designated as the 'primary' credential for the user. This column is not currently used, but is retained from Unity 4.x in case it is needed in the future.	Bool
	Locked	smallint (2 bytes)	A flag indicating whether access to the user account associated with this set of credentials is locked.	Bool
	ObjectId	char (36 characters)	Surrogate key to support IMS	ObjectID
	TimeChanged	datetime (8 bytes)	The date and time when the credentials were last changed. The date and time is recorded in this column whenever a user credential is created or changed.	
	TimeHacked	datetime (8 bytes)	The date and time that the credential was locked due to too many hacks. The date and time is recorded in this column whenever a user credential is locked due to too many hacks based on the credential policy.	
	TimeLastHack	datetime (4 bytes)	The date and time of the last logon attempt with an invalid user credential.	
	TimeLockout	datetime (8 bytes)	The date and time that the credential was locked by an administrator.	
PK	UserObjectId	char (36 characters)	The unique identifier of the User object to which this credential belongs.	ObjectID

Stored Procedures

Name	Description
csp_CredentialCreate	Creates new Credential object for a user by inserting a new row into tbl_Credential. When a new credential is created, this procedure will also create a new UserCredentialHistory object for the respective user by inserting a new row in tbl_UserCredentialHistory for the respective user. This is done by executing csp_private_UserCredentialHistoryCreate. To change the properties of a user's credential, see csp_CredentialModify.
csp_CredentialDelete	Deletes a user's Credential object from tbl_Credential as specified by the @ObjectId parameter.

Name	Description
csp_CredentialModify	Updates the attributes of a Credential object based on the values passed in via the parameters. The @CredentialType and @UserObjectId parameters identify the Credential object that is updated.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CantChange

Property Name	Value
Description:	A flag indicating whether the user can set this credential.
Notes:	<p>Most organizations normally want to allow users to set their credentials. However, there are cases where this may not be desired. For example, when more than one user has access to the same account, an administrator can set the password/PIN and not allow the users to change it.</p> <p>Values: 0: User can change credential 1: User cannot change credential</p>

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.CantChange
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CredentialPolicyObjectId

Property Name	Value
Description:	The unique identifier of the CredentialPolicy object that is associated with this credential.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.CredentialPolicyObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Credentials

Property Name	Value
Description:	The PIN or password, for a user. The credentials are stored in an encrypted format.
Notes:	A user may have multiple sets of credentials. For example, a user may have one set of credentials for accessing their voice mail subscription via the phone (i.e., PIN) and a different set of credentials (i.e., password) for accessing their voice mail subscription via a GUI client such as CPCA. Or a user may have a set of Windows credentials.
Business Rules:	<ul style="list-style-type: none"> * A value of NULL indicates that the credential has not been initialized. In other words, it is disabled. A value of NULL does NOT mean that the value of the credential == blank. * TUI credentials (i.e., DTMF) can contain only digits 0-9. Reg Ex: [0-9]+\$ * GUI credentials can contain any alphanumeric ASCII character and all ASCII special characters. (See "Reg Ex" description.) <p>Regex=<code>^[a-zA-Z0-9`~!@#%&^*\(\)\-_\+=\[\]\{\}\ \\ ;:'",\.\^?<>\s]+\$</code> Desc=ASCII only. Any alphanumeric character. The following special characters: <code>~!@#%&^*()_+--{\} \ ['";<>?/.,)</code></p>
Developer Notes:	
Table/Column Mapping:	tbl_Credential.Credentials
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Credentials
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CredentialType

Property Name	Value
Description:	The type of credential such as password, PIN, Windows or Domino credential.
Notes:	<p>A user may have multiple types of credentials. The default value represents a PIN credential.</p> <p>Values:</p> <ul style="list-style-type: none"> 1: Windows credential. 2: Domino credential. 3: Password (such as would be used with a GUI client). 4: PIN (as would be used over the phone via the TUI).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.CredentialType
Primary Key:	True

Property Name	Value
Allow Null:	False
Default Value:	4
Custom Type:	CredentialType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CredMustChange

Property Name	Value
Description:	A flag indicating whether the user must change their credentials (PIN or password) at the next login.
Notes:	<p>This column is used to force a user to change their credentials such as changing their default phone PIN or GUI client password at login during first-time enrollment, or on a regularly scheduled basis as part of a recommended security policy, or when an administrator changes the PIN or password at the user's request to a value known by the user.</p> <p>Values: 0: User does not have to change credential 1: User must change credential</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.CredMustChange
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DoesntExpire

Property Name	Value
Description:	A flag indicating whether this user credential will expire, and therefore the user must change the credential periodically. However, if the credential does not expire (value = "1"), the user still may change the credential (if allowed by CantChange).
Notes:	<p>The scope of this setting is per credential. It enables an administrator to disable credential expiration on a per credential/user basis while maintaining a credential expiration policy for all users on the system. For example, this can be used for low security accounts, or for accounts that can be accessed by more than one user (future requirement).</p> <p>Values: 0: Credential does expire 1: Credential does not expire</p>
Business Rules:	A value of '0' (false) means the expiration of the credential is controlled by the value of tbl_CredentialPolicy->MaxDays.
Developer Notes:	
Table/Column Mapping:	tbl_Credential.DoesntExpire
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EncryptionType

Property Name	Value
Description:	Type of encryption that was used to generate the credentials.
Notes:	<p>Values: 0: Unknown encryption method 1: MD5 hash 2: SHA1 hash 3: IMS generated hash 4: Reversible encryption used 5: No encryption</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.EncryptionType
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	EncryptionType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

HackCount

Property Name	Value
Description:	The number of logons attempted that failed due to invalid credentials. The Unity system or external authentication provider determined that the credentials supplied as part of a user logon attempt were invalid.
Notes:	The HackCount column is cleared (i.e., reset to a value of 0) when the number of minutes expires as specified in the tbl_CredentialPolicy.HackResetTime column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.HackCount
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Hacked

Property Name	Value
Description:	A flag indicating whether access to the user account associated with this set of credentials is locked due too many hack attempts.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this credential is mapped to the user NT/AD domain account and as such is designated as the 'primary' credential for the user. This column is not currently used, but is retained from Unity 4.x in case it is needed in the future.
Notes:	<p>Currently IsPrimary column is not used. However, in the future it may be necessary once again to have the ability to map a user account with a domain account.</p> <p>In Unity 4.x, when Unity creates a subscriber, Unity automatically creates a mapping between the subscriber account and the subscriber Windows domain account. This is called a 'primary' link and IsPrimary column is set to true. The subscriber's Unity alias will match their AD alias. If additional links are added to that account or other accounts using the GrantUnityAccess tool, these are entered as non primary links (meaning they're alternate domain account mappings).</p>
Business Rules:	
Developer Notes:	The only practical use of the IsPrimary column data is actually used in the Credentials Viewer tool. It can show which mappings have been made manually so an administrator can edit them (or remove them all) easily without removing everyone's primary association (which should technically never be deleted).
Table/Column Mapping:	tbl_Credential.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Locked

Property Name	Value
Description:	A flag indicating whether access to the user account associated with this set of credentials is locked.
Notes:	<p>There are several conditions that can cause access to a user account for a particular credential to be locked:</p> <ul style="list-style-type: none"> * If the template used to create a user has locked enabled, the new account is locked automatically when the user account is created. * An administrator via an administrative application such as Cisco Unity Connection Administration may lock a user account. <p>Values: 0: Account is not locked. 1: Account is locked.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	Surrogate key to support IMS
Notes:	The combinatoin of UserObjectId/CredentialType is the primary key, but for IMS it was simpler to have a single oid on credentials.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.ObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeChanged

Property Name	Value
Description:	The date and time when the credentials were last changed. The date and time is recorded in this column whenever a user credential is created or changed.
Notes:	Used to determine if the user needs to change their credentials when they log-in depending on their credential expiration policy setting (DoesntExpire) and their credential password policy settings (tbl_PasswordPolicy->MaxPasswordDays).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.TimeChanged
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeHacked

Property Name	Value
Description:	The date and time that the credential was locked due to too many hacks. The date and time is recorded in this column whenever a user credential is locked due to too many hacks based on the credential policy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Credential.TimeHacked
Primary Key:	False
Allow Null:	True
Default Value:	NULL

5.65. vw_CredentialPolicy

A simple view for tbl_CredentialPolicy.

A system-wide credential restriction settings for a specific credential type and a lockout policy that applies when users access Cisco Unity Connection.

Additional Information

A different credential policy can be specified for each type of credential. For example, one policy can be defined for user access via the phone using a PIN. Another policy can be defined for user access via a GUI client that takes advantage of a much larger character set in creating a strong password for extra security.

This is in it's own table since at some point down the road there will be a need to provide multiple credential policies for multiple tenants on a single VMS. Currently, however, the credential policy applies system-wide to all users residing on a VMS.

This table combines the data that in Unity 4.x was contained in the PWPPolicy and AccountLockoutPolicy tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name (e.g., "Administrator Password Policy") of the credential policy to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	ExpiryWarningDays	int (4 bytes)	The number of days prior to the expiration of a credential when Cisco Unity Connection begins prompting a user to change their credential upon logon, until the change is made.	
	HackResetTime	smallint (2 bytes)	The length of time (in minutes) after which if no failed logon attempts occur, the count of failed logon attempts is cleared.	
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this credential policy belongs.	ObjectID
	LockoutDuration	smallint (2 bytes)	The length of time (in minutes) that a user who is locked out must wait until they can attempt to access the system again with this credential.	
	MaxDays	smallint (2 bytes)	The maximum number of days before the credential must be changed.	
	MaxHacks	smallint (2 bytes)	The maximum number of failed logon attempts (hacks) before action is taken.	
	MinDuration	int (4 bytes)	The minimum number of minutes that must pass from the time of the last change before the credential can be changed.	
	MinLength	smallint (2 bytes)	The minimum number of characters or digits (PIN) required for the credential.	

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a CredentialPolicy object.	ObjectID
	PrevCredCount	smallint (2 bytes)	The number of credentials to store.	
	TrivialCredChecking	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should check against trivial credentials for extra security.	Bool

Stored Procedures

Name	Description
csp_CredentialPolicyCreate	Creates a new CredentialPolicy object by inserting a new row into tbl_CredentialPolicy. A CredentialPolicy object consists of system-wide credential restriction settings for a specific credentials type and a lockout policy that applies when users access Cisco Unity Connection.
csp_CredentialPolicyDelete	Deletes a CredentialPolicy object from tbl_CredentialPolicy as specified by the @ObjectId parameter.
csp_CredentialPolicyModify	Updates the attributes of a CredentialPolicy object based on the values passed in via the parameters. The @ObjectId parameter identifies the CredentialPolicy object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The unique text name (e.g., "Administrator Password Policy") of the credential policy to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	DisplayName is a required when creating a new CredentialPolicy.
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.

Property Name	Value
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ExpiryWarningDays

Property Name	Value
Description:	The number of days prior to the expiration of a credential when Cisco Unity Connection begins prompting a user to change their credential upon logon, until the change is made.
Notes:	A value of "0" means that a user will not be prompted to change their credential prior to its expiration.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.ExpiryWarningDays
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

HackResetTime

Property Name	Value
Description:	The length of time (in minutes) after which if no failed logon attempts occur, the count of failed logon attempts is cleared.
Notes:	tbl_Credentials->HackCount associated with this credential type is reset to a value of zero after this many minutes pass from the time contained in tbl_Credentials->TimeLastHack.
Business Rules:	The count of failed logon attempts is not cleared if the number of failed logon attempts has reached the maximum number allowed and the credential is locked.
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.HackResetTime
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	30
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	120

LocationObjectId

Property Name	Value
Description:	The unique identifier of the Location object to which this credential policy belongs.
Notes:	The default value is the delivery location for this VMS.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LockoutDuration

Property Name	Value
Description:	The length of time (in minutes) that a user who is locked out must wait until they can attempt to access the system again with this credential.
Notes:	Unity allows users to access the system using this credential after the specified number of minutes has elapsed.

Property Name	Value
Business Rules:	A value of "0" means the user is locked out until the credential/account is unlocked by an administrator.
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.LockoutDuration
Primary Key:	False
Allow Null:	False
Default Value:	30
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	1440

MaxDays

Property Name	Value
Description:	The maximum number of days before the credential must be changed.
Notes:	<p>The default value is 180 days when creating a credential policy associated with user accounts that do NOT have administrative access or privileges (i.e., normal user account with voice mail subscription).</p> <p>The default value is 120 days when creating a credential policy associated with user accounts that have administrative access and privileges.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.MaxDays
Primary Key:	False
Allow Null:	False
Default Value:	180
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	365

MaxHacks

Property Name	Value
Description:	The maximum number of failed logon attempts (hacks) before action is taken.
Notes:	A value of "0" means an unlimited number of logon attempts (i.e., no lockout) are allowed.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.MaxHacks
Primary Key:	False
Allow Null:	False
Default Value:	3
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

MinDuration

Property Name	Value
Description:	The minimum number of minutes that must pass from the time of the last change before the credential can be changed.
Notes:	The purpose of this setting is to prevent multiple changes to a user credential within a short period of time. A user cannot change this credential until the currently day/time equals or exceeds the time recorded in tbl_Credential->TimeChanged for this credentialtype plus the number of minutes specified by MinDuration.
Business Rules:	A value of "0" means that there are no restrictions on how often the user can change the credential.
Developer Notes:	The max is 90 days = 129600 mins.
Table/Column Mapping:	tbl_CredentialPolicy.MinDuration
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	129600

MinLength

Property Name	Value
Description:	The minimum number of characters or digits (PIN) required for the credential.
Notes:	A value of "0" means a blank credential, e.g. no password or PIN is allowed.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.MinLength
Primary Key:	False
Allow Null:	False
Default Value:	8
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	64

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a CredentialPolicy object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PrevCredCount

Property Name	Value
Description:	The number of credentials to store.
Notes:	Unity stores the specified number of previous credentials for a user and compares a new credential with them. Unity rejects the new credential if it matches a credential in the history. If blank credentials are allowed, this data is ignored.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.PrevCredCount
Primary Key:	False
Allow Null:	False
Default Value:	12
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	25

TrivialCredChecking

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should check against trivial credentials for extra security.
Notes:	Values: 0: Checking for trivial credentials is disabled 1: Checking for trivial credentials is enabled

Property Name	Value
Business Rules:	<p>If blank credentials are allowed (MinLength column = 0), check against trivial credential is disabled.</p> <p>If enabled, Unity will verify that the credential meets the criteria as specified by the type of credential:</p> <p>Password (GUI):</p> <ul style="list-style-type: none"> * It must contain 3 of the 4 allowable characteristics: <ul style="list-style-type: none"> - Upper case character - Lower case character - Number - Symbol * A character or number shall not be used more than 3 times consecutively. * Password should not repeat or include the alias, username or extension. * Password cannot consist of consecutive characters or numbers (For example: passwords such as 654321 or ABCDEFG). <p>PIN (TUI):</p> <ul style="list-style-type: none"> * A number shall not be used more than 2 times consecutively * PIN should not repeat or include the user's extension or mailbox, or the reverse of the user's extension or mailbox. * A PIN must contain 3 different numbers. For example, a PIN such as 121212 is trivial. * A pin shall not match the numeric representation (i.e. dial by name) of the user's first or last name. * A PIN shall not contain groups of repeated digits, e.g. 408408, 113377 or patterns that are dialed in straight line on a keypad, e.g. 2580, 159, 753.
Developer Notes:	
Table/Column Mapping:	tbl_CredentialPolicy.TrivialCredChecking
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.66. vw_CurrentPrivileges

The discrete rights granted to perform an operation (i.e. privileges) based on a user (subject). This view is used to fetch user authorization information - get the name of the operations (views and stored procedures) that the user is authorized to perform.

Additional Information

This view is comprised of all the columns in the tbl_Privileges table, plus four additional columns defined in the tbl_Policy table. Privileges associated with policies that have expired are excluded from this view.

To retrieve a list of privileges for a user, select against this view using a "WHERE" clause to specify SubjectObjectId = the user id. For example, WHERE SubjectObjectId=@UserObjectId.

Privileges are additive. For example, assume a scenario where a privilege exists for more than one role. For one role UpdateAccess is denied (value of 0) , and for another role UpdateAccess is granted (value of 1), then UpdateAccess is granted.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CreateAccess	smallint (2 bytes)	A flag indicating authorization to create a new instance of a particular object. For example, the ability to create distribution lists on the system and assign members.	Bool
	DeleteAccess	smallint (2 bytes)	A flag indicating authorization to delete an instance of an object. For example, the ability to delete a Class of Service (COS) from the system.	Bool
	ExecuteAccess	smallint (2 bytes)	A flag indicating authorization to execute (i.e. run) an application such as the ability to run Reports or to execute a tool or utility program.	Bool
PK	OperationName	lvvarchar (256 characters)	Name of operation associated with the privilege.	
	ReadAccess	smallint (2 bytes)	A flag indicating authorization to read (i.e., view) an object and its attributes. For example, the ability to read all the distribution lists on the system and their associated attributes such as members.	Bool
	ResourceType	int (4 bytes)	The type of resource (object) associated with this privilege. For example, Distribution Lists, Users, Classes of Service, Mailbox Databases, etc.	ResourceType
	TargetAgencyObjectId	char (36 characters)	The unique identifier of the Agency object to which this policy applies.	ObjectID
	TargetDistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object to which this policy applies.	ObjectID
	TargetHandlerObjectId	char (36 characters)	The unique identifier of the Handler object to which this policy applies.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	TargetUserObjectId	char (36 characters)	The unique identifier of the user object to which this policy applies.	ObjectID
	TargetVmsObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this policy applies.	ObjectID
	UpdateAccess	smallint (2 bytes)	A flag indicating authorization to change the attribute(s) of an object. For example, the ability to change Class of Service (COS) settings.	Bool
	UserObjectId	char (36 characters)	The unique identifier of the User object (subject) to which this policy is assigned.	ObjectID
	VmsObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this policy applies.	ObjectID

Stored Procedures

vw_CurrentPrivileges has no stored procedures.

Column Properties

CreateAccess

Property Name	Value
Description:	A flag indicating authorization to create a new instance of a particular object. For example, the ability to create distribution lists on the system and assign members.
Notes:	Values: 0: Not authorized to create a new instance of a particular object 1: Authorized to create a new instance of a particular object
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.CreateAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DeleteAccess

Property Name	Value
Description:	A flag indicating authorization to delete an instance of an object. For example, the ability to delete a Class of Service (COS) from the system.
Notes:	Values: 0: Not authorized to delete an instance of a particular object 1: Authorized to delete an instance of a particular object
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.DeleteAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ExecuteAccess

Property Name	Value
Description:	A flag indicating authorization to execute (i.e. run) an application such as the ability to run Reports or to execute a tool or utility program.
Notes:	Values: 0: Not authorized to run a particular application 1: Authorized to run a particular application
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.ExecuteAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

OperationName

Property Name	Value
Description:	Name of operation associated with the privilege.
Notes:	This is normally the name of a stored procedure or view.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PrivilegeOperationMap.OperationName
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ReadAccess

Property Name	Value
Description:	A flag indicating authorization to read (i.e., view) an object and its attributes. For example, the ability to read all the distribution lists on the system and their associated attributes such as members.
Notes:	Values: 0: Not authorized to read an object and its attributes 1: Authorized to read an object and its attributes
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.ReadAccess
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ResourceType

Property Name	Value
Description:	The type of resource (object) associated with this privilege. For example, Distribution Lists, Users, Classes of Service, Mailbox Databases, etc.

Property Name	Value
Notes:	<p>Values:</p> <p>1: Managing networking (Unity networking, dialing domains, delivery locations for foreign voice messaging systems)</p> <p>10: Managing Shared Distribution Lists.</p> <p>11: Managing restriction tables and restriction patterns.</p> <p>12: Managing call routing rules.</p> <p>13: Managing system schedules and holidays.</p> <p>14: Managing Administrative Regions. For example, the privilege to add/remove VMS configurations to/from an administrative region, or view a list of VMS configurations that compose an administrative region.</p> <p>15: Managing Unity organization. For example, the privileges to change the name of the organization, add/remove administrative regions to/from an organization, or view a list of administrative regions and VMS configurations that compose the Unity organization.</p> <p>16: Managing server(s) in a VMS configuration. For example, the privileges to add/delete a front-end or back-end server to/from the VMS configuration, activate/deactivate a server role on a VMS configuration.</p> <p>17: Managing server role templates. For example, the privileges to read/update VMS server role templates.</p> <p>18: Managing user groups. For example, the privileges to add/delete users to/from a user group, or create/delete a user group.</p> <p>19: Managing call handlers, call handler templates, and interview handlers. For example, the privileges to create/delete call and interview handlers, or to read/update call and interview handlers and call handler templates.</p> <p>2: Managing administrative roles (includes managing user to role relationships)</p> <p>20: Managing VMS server configuration settings, Report system settings and licensing settings. For example, the privileges to read/update the system's recording settings, phone and GUI language settings, voice messaging port settings, enable/disable a VMS configuration's participation in the Unity Organization license pool, etc.</p> <p>21: Run system reports and execute system reporting tools. For example, the privileges to run any of the System Reports such as the Administrative Access Report and any of the system reporting tools such as the Port Usage Analyzer tool.</p> <p>22: Run subscriber and mailbox reports. For example, the privileges to run any of the subscriber reports such as the Subscriber Message Activity Report or any of the Mailbox reports such as the Mailbox Database Information Report.</p> <p>23: View all reports. The privileges to view all system, subscriber and mailbox reports.</p> <p>24: Reset user passwords or PINs, and unlock user accounts.</p> <p>25: Reset administrative user account passwords and unlock administrative user accounts. For example, the privileges to reset the password for a user assigned the role of a 'Technician.'</p> <p>26: Managing Cisco Unity Connection security and user account lockout policies. For example, the privileges to read/update GUI/phone password restrictions and account lockout policies.</p> <p>27: Run all administration tools. For example, the privileges to run Disaster Recovery Backup/Restore tool, Subscriber Information Dump, TTY Angel, etc.</p> <p>28: Run ALL diagnostic, audio management and phone system integration tools. For example, the privileges to run the Set Record Format tool, CodecChecker tool, Cisco Unity Connection Performance Information and Diagnostics tool, Integration Monitor, Call Viewer, etc.</p> <p>29: Run status monitor application for monitoring system activity.</p> <p>3: Managing users</p> <p>30: Phone system.</p> <p>31: View and retrieve Configuration objects, localized text, and TreeControlNodes.</p> <p>32: IF (@NumericId IS NOT NULL) RAISERROR({GetExceptionCode("EXCEPTION_PERSONALGROUP_NUMERICID_INVALID") <@SEVERITY_INVALID_PARAMETER/>, 1, 'NULL', '0') <@StoredProcReturn GetExceptionCode("EXCEPTION_PARAMETER_INVALID")/></p>

Property Name	Value
	33: Managing Greetings. For example, the privilege to change the greeting for a call handler via the TUI. 34: Agency. Used by Community Voice Mail feature. 35: Web service access. 36: Managing interview handlers 37: Access serviceability page 38: VPIM controls 4: Changing User Name Attributes. 5: Managing users in bulk. 6: Managing user templates. 7: Managing mailbox databases. 8: Managing COS. 9: Managing directory handlers.
Business Rules:

Validation - Minimum Value:	
Validation - Maximum Value:	

TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the Handler object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetUserObjectId

Property Name	Value
Description:	The unique identifier of the user object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetUserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetVmsObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this policy applies.
Notes:	This identifies the particular area (i.e., a node in the organizational hierarchy) of a Unity Organization that this policy applies to. For now, this can only be a LocationVMS, although in the future we do support multiple primary VMS as a method of partitioning.
Business Rules:	Only one Target may be specified for a Policy.

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetVmsObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UpdateAccess

Property Name	Value
Description:	A flag indicating authorization to change the attribute(s) of an object. For example, the ability to change Class of Service (COS) settings.
Notes:	Values: 0: Not authorized to change the attributes of an object 1: Authorized to change the attributes of an object
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.UpdateAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object (subject) to which this policy is assigned.
Notes:	
Business Rules:	
Developer Notes:	May want to add DL or UserGroup as subject later, but for now it is just a User.
Table/Column Mapping:	tbl_Policy.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:

Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.67. vw_DirectoryHandler

A call routing object that enables outside callers to search for subscribers by spelling their name in the case where they don't know the user's extension number. When a caller searches on a subscriber name or part of a name, a directory handler looks up the extension and routes the call to the appropriate subscriber. Formerly called "NameLookupHandler."

Additional Information

This view is comprised of the columns in the tbl_Handler and tbl_DirectoryHandler tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AutoRoute	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will automatically route a call to the extension assigned to the subscriber on a unique match without prompting the caller to verify the match; or to present a list of matches, even if only one, and prompt the user to verify the match.	Bool
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	EndDialDelay	smallint (2 bytes)	The amount of time (in seconds) that Cisco Unity Connection waits after caller input before performing the action indicated by the input.	
	Exit_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	Exit_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	Exit_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	ExitCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which calls are sent) if the caller presses the "exit" key (star or pound/hash).	ObjectID
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxMatches	smallint (2 bytes)	The number of matches, that if exceeded, will result in Cisco Unity Connection prompting the caller to dial more letters.	
	MenuStyle	smallint (2 bytes)	A flag indicating how Cisco Unity Connection presents directory matches to callers - either in "menu choice" or "extension list" format.	Bool
	NoInput_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	NoIn-put_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	NoIn-put_TargetHandlerObjec- tId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	NoInputCallActionOb- jectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which calls are sent) if the caller does not enter a name or by not responding to prompts.	ObjectID
	NoSelection_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	NoSelec- tion_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	NoSelec- tion_TargetHandlerObjec- tId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	NoSelectionCallAc- tionObjectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which the caller is sent to) if the caller makes no selection from a list of matches.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DirectoryHandler object.	ObjectID
	PlayAllNames	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the names of subscribers in the directory for caller selection, rather than requiring the caller to search by spelled name.	Bool
	SayExtension	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection provides a menu of subscriber names including extensions, or just subscriber names.	Bool
	ScopeObjectCosObjectId	char (36 characters)	The unique identifier of the COS which acts as the filter for the directory handler.	ObjectID
	ScopeObjectDistribu- tionListObjectId	char (36 characters)	The unique identifier of the distribution list which acts as the filter for the directory handler.	ObjectID
	ScopeObjectLocationOb- jectId	char (36 characters)	The unique identifier of the location which acts as the filter for the directory handler.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	SearchByFirstName	smallint (2 bytes)	A flag indicating whether a directory handler searches for subscribers by using first name first, or last name first.	Bool
	SearchScope	smallint (2 bytes)	The scope of the directory that Cisco Unity Connection will search.	SearchScope
	SearchScopeObjectId	char (36 characters)	The three possible object references are coalesced into this column for backwards compatibility.	ObjectID
	StartDialDelay	smallint (2 bytes)	The amount of time (in seconds) that Cisco Unity Connection waits for the caller to start dialing. Time to wait for caller to start dialing in seconds. This is controlled on the SA's Caller Input 'timeout if no input in seconds' setting.	
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectID
	Tries	smallint (2 bytes)	The number of times Cisco Unity Connection will reprompt the caller for input, e.g. dial name.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this directory handler is derived from the directory handler object attribute or the default language from the location to which the directory handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool
	UseStarToExit	smallint (2 bytes)	A flag indicating the key on the phone to use for "exit the directory." This controls whether the directory handler uses star ("*") to exit (like the rest of the conversation) or pound/hash ("#") to exit.	Bool
	VoiceEnabled	smallint (2 bytes)	A flag indicating whether the directory handler will use voice based addressing rather than touchtones.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid
	Zero_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	Zero_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	Zero_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	ZeroCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which calls are sent) if caller presses zero ("0") key during menu style list of names.	ObjectID

Stored Procedures

Name	Description
csp_DirectoryHandlerCreate	Creates a new DirectoryHandler object by inserting a new row into tbl_DirectoryHandler. This procedure also creates several other objects: <ul style="list-style-type: none"> * The call actions for Exit, No Input, No Selection and Zero conditions by inserting a new row into tbl_CallAction for each condition. * A new handler by inserting a new row into tbl_Handler * If provided, a new DtmfAccessId by inserting a new row into tbl_DtmfAccessId * If provided, a new voice name for the interview handler by activating an existing StreamFile object in tbl_StreamFile that was allocated using csp_AllocateVoiceFile.
csp_DirectoryHandlerDelete	Deletes a DirectoryHandler object from tbl_DirectoryHandler as specified by the @ObjectId parameter. This procedure also deletes several objects related to a DistributionList object: <ul style="list-style-type: none"> * The base Handler object in tbl_Handler. * Each of the four CallAction objects in tbl_CallAction related to this DirectoryHandler. * If there is an extension number assigned to the DirectoryHandler, the related DtmfAccessId object is deleted from tbl_DtmfAccessId. * If the DirectoryHandler has a recorded voice name, the related StreamFile object is deleted from tbl_StreamFile by executing csp_StreamFileDelete.
csp_DirectoryHandlerModify	Updates the attributes of a DirectoryHandler object based on the values passed in via the parameters. The @ObjectId parameter identifies the DirectoryHandler object that will be updated. This procedure will also update the AfterMessageAction, DtmfAccessId and VoiceName, if the parameters are passed in.

Column Properties

AutoRoute

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will automatically route a call to the extension assigned to the subscriber on a unique match without prompting the caller to verify the match; or to present a list of matches, even if only one, and prompt the user to verify the match.

Property Name	Value
Notes:	Values: 0: Presents a list of matches, even if only one, and prompts the user to verify the match. 1: Automatically routes a call to the extension assigned to the subscriber on a unique match without prompting the caller to verify the match. or to p
Business Rules:	
Developer Notes:

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	10

Exit_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation

SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ExitCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which calls are sent) if the caller presses the "exit" key (star or pound/hash).
Notes:	<p>This value references a tbl_CallAction->ObjectId. Possible destinations or actions are:</p> <ul style="list-style-type: none"> * Send caller to a call handler * Send caller to another directory handler * Send caller to a greetings administrator i.e., a conversation for changing call handler greetings over the phone. * Send caller to a interview handler * Hang-up * Send caller to sign-in i.e., subscriber logon conversation. * Send caller to a subscriber extension
Business Rules:	The default value is a tbl_CallAction.ObjectId that references a call handler.
Developer Notes:	
Table/Column Mapping:	tbl_DirectoryHandler.ExitCallActionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

NoInput_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Validation - Minimum Value:	
Validation - Maximum Value:	

SearchByFirstName

Property Name	Value
Description:	A flag indicating whether a directory handler searches for subscribers by using first name first, or last name first.
Notes:	Values: 0: Search by last name, then first name. 1: Search by first name, then last name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DirectoryHandler.SearchByFirstName
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SearchScope

Property Name	Value
Description:	The scope of the directory that Cisco Unity Connection will search.

Property Name	Value
Notes:	Used to restrict the directory handler searches to the Local VMS, a location, a dialing domain, a distribution list, a class of service, or to expand searches to the entire Unity organization (i.e., global). Values: 0: VMS - directory handler search restricted to the local VMS. 1: Dialing domain - directory handler search restricted to a dialing domain. 2: Global - directory handler search expanded to the entire Unity organization (global). 3: Location - directory handler search restricted to a Unity location. 4: Distribution list - directory handler search is restricted to a distribution list. 5: COS - directory handler search restricted to a class of service.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DirectoryHandler.SearchScope
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	SearchScope
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SearchScopeObjectId

Property Name	Value
Description:	The three possible object references are coalesced into this column for backwards compatibility.
Notes:	If the search scope is a location or class of service, this ID refers to the ObjectId of the respective object. If the search scope is a distribution list, this ID references the ObjectId for the respective ScopeDlist object, not the ObjectId of the DistributionList. See "tbl_ScopeDList" for information about scope distribution lists. If the search scope is initially set to a local VMS, dialing domain or global, this column contains NULL. If however SearchScope is initially set to a COS, location or distribution list, and then changed to a local VMS, a dialing domain or global, the SearchScopeObjectId is not nulled out as one might expect. Rather since the SearchScopeObjectId is ignored if the SearchScope is set to a local VMS, a dialing domain, or global, the SearchScopeObjectId is left alone so that if it is changed back, the object does not have to be re-entered.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False

Undeleteable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeleteable

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Zero_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Zero_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ZeroCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that Cisco Unity Connection performs (or the destination to which calls are sent) if caller presses zero ("0") key during menu style list of names.
Notes:	<p>This value applies only if "MenuStyle" = 1.</p> <p>This value references a tbl_CallAction->ObjectId. Possible destinations or actions are:</p> <ul style="list-style-type: none"> * Send caller to a call handler * Send caller to another directory handler * Send caller to a greetings administrator i.e., a conversation for changing call handler greetings over the phone. * Send caller to a interview handler * Hang-up * Send caller to sign-in i.e., subscriber logon conversation. * Send caller to a subscriber extension
Business Rules:	The default value is a tbl_CallAction.ObjectId that references a call handler.
Developer Notes:	
Table/Column Mapping:	tbl_DirectoryHandler.ZeroCallActionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.68. vw_DirectoryHandler_List

A narrow view of a directory handler. This view provides a list of all directory handlers, which is used by CUSA to provide list of directory handlers in drop-down lists. It contains only the ObjectId and DisplayName for each directory handler.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DirectoryHandler object.	ObjectID

Stored Procedures

vw_DirectoryHandler_List has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a DirectoryHandler object.
Notes:	The value of this objectid is the same as the objectid of its associated base object in tbl_Handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DirectoryHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.69. vw_DistributionList

A group of recipients created to send a message to all members of the group. When a message is sent to a distribution list, all members of the list receive a copy of the message. Formerly referred to as "Public" distribution lists.

Additional Information

This view is comprised of all the columns in the tbl_DistributionList, plus an additional VoiceName column that is defined in tbl_StreamFile.FileName.

Top level members of these system distribution lists are stored in the DistributionListMember table.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AllowContacts	smallint (2 bytes)	A flag indicating whether contacts (system, VPIM, virtual) are allowed to be members of this Distribution List. Purpose of this flag is to enable administrators to create a Distribution List whose members are Unity users only.	Bool
	AllowForeignMessage	smallint (2 bytes)	Controls if we allow foreign message systems to send to this particular distribution list. Only valid if the list is for subscribers only (i.e. does not allow contacts)	Bool
	AltName	nvarchar (64 characters)	The alternate spelling of the distributionlist name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing.	
	CreationTime	datetime (8 bytes)	The date and time the system distribution list was created.	
	DisplayName	nvarchar (64 characters)	The unique text name of the system distribution list to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id (i.e., extension) for the distribution list.	DtmfAccessId
	DtmfName	varchar (16 characters)	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the system distribution list. These digits are used for searching the distribution list by name via the phone.	DtmfName

Key	Name	SQL Data Type/Length	Description	Custom Type
	IsPublic	smallint (2 bytes)	A flag indicating whether the system distribution list is addressable by all subscribers on all VMSeS throughout the Unity Organization.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this system distribution list belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DistributionList object.	ObjectID
	Undeetable	smallint (2 bytes)	A flag indicating whether this distribution list can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_DistributionListCreate	Creates a new DistributionList object by inserting a new row into tbl_DistributionList. It also creates a new Alias object in tbl_Alias by executing csp_AliasCreate. Two other objects may also be created: * If a DtmfAccessID is passed in, a new DtmfAccessId object is created by executing csp_DtmfAccessIdCreate. * If a VoiceName is passed in, a new StreamFile object is created by executing csp_StreamFileModify.
csp_DistributionListDelete	Deletes a DistributionList object from tbl_DistributionList as specified by the @ObjectId parameter. This procedure also deletes several objects related to a DistributionList object: * Any member mappings in tbl_DistributionListMember where the specified distribution list is the member of another distribution list are deleted. * The related Alias object is deleted from tbl_Alias by executing csp_AliasDelete. * If there is an extension number assigned to the DistributionList, the related DtmfAccessId object is deleted from tbl_DtmfAccessId. * If the DistributionList has a recorded voice name, the related StreamFile object is deleted from tbl_StreamFile by executing csp_StreamFileDelete.
csp_DistributionListModify	Updates the attributes of a DistributionList object based on the values passed in via the parameters. The @ObjectId parameter identifies the DistributionList object that will be updated. This procedure will also update the DtmfAccessId and VoiceName, if the parameters are passed in. See notes for additional information.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AllowContacts

Property Name	Value
Description:	A flag indicating whether contacts (system, VPIM, virtual) are allowed to be members of this Distribution List. Purpose of this flag is to enable administrators to create a Distribution List whose members are Unity users only.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.AllowContacts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AllowForeignMessage

Property Name	Value
Description:	Controls if we allow foreign message systems to send to this particular distribution list. Only valid if the list is for subscribers only (i.e. does not allow contacts)
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.AllowForeignMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AltName

Property Name	Value
Description:	The alternate spelling of the distributionlist name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing.
Notes:	Used to enable name lookup and message addressing via the TUI client when the alias contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and the distribution list alias is composed of Kanji characters, to enable users and callers to search for a distribution list name via the phone, an alternate spelling of the distribution list name in ASCII characters can be stored in the altname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.AltName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the system distribution list was created.
Notes:	
Business Rules:	
Developer Notes:	The default value is the current date and time - GETUTCDATE()
Table/Column Mapping:	tbl_DistributionList.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of the system distribution list to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)

Property Name	Value
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id (i.e., extension) for the distribution list.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.@,;\+\\ \%?\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the system distribution list. These digits are used for searching the distribution list by name via the phone.
Notes:	
Business Rules:	When the display name of a system distribution list is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.DtmfName

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPublic

Property Name	Value
Description:	A flag indicating whether the system distribution list is addressable by all subscribers on all VMSES throughout the Unity Organization.
Notes:	Values: 0: Distribution list is not addressable by all subscribers. 1: Distribution list is addressable by all subscribers on all VMSES.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.IsPublic
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this system distribution list belongs.
Notes:	
Business Rules:	
Developer Notes:	Important in K2 for replication.
Table/Column Mapping:	tbl_DistributionList.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a DistributionList object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this distribution list can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	<p>This setting is used to prevent the deletion of factory defaults such as the "All Subscribers" distribution list included with every VMS.</p> <p>Values:</p> <p>0: The distribution list can be deleted by an administrator (with the required privilege) via Cisco Unity Connection Administration, Cisco Unity Connection Bulk Administration Manager or administrative application.</p> <p>1: The distribution list cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.70. vw_DistributionList_List

The basic attributes of a distribution list used for retrieving a list of distribution lists.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	DisplayName	nvarchar (64 characters)	The unique text name of the system distribution list to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName

Validation - Maximum Value:	

MemberContactObjectId

Property Name	Value
Description:	The member of this distribution list. If the member is a contact, the unique identifier of the Contact object that is a member of the distribution list. Otherwise, this attribute is set to NULL.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.MemberContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberDistributionListObjectId

Property Name	Value
Description:	The member of this distribution list. If the member is a virtual contact, the unique identifier of the VirtualContact object that is a member of the distribution list. Otherwise, this attribute is set to NULL.
Notes:	
Business Rules:	<ul style="list-style-type: none"> * A distribution list cannot be a member of its own distribution list. * One of the Member* columns must have a non-NULL value while the remaining Member* columns must contain NULL.
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.MemberDistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberUserObjectId

Property Name	Value
Description:	The member of this distribution list. If the member is a user, the unique identifier of the User object that is a member of the distribution list. Otherwise, this attribute is set to NULL.
Notes:	
Business Rules:	One of the Member* columns must have a non-NULL value while the remaining Member* columns must contain NULL.
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.MemberUserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters

Property Name	Value
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a DistributionListMember object.
Notes:	Surrogate key for this table to facilitate membership links to more than one thing.
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.72. vw_DistributionListMemberTemplate

A distribution list member template.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AllowForeignMessage	smallint (2 bytes)	Controls if we allow foreign message systems to send to this particular distribution list. Only valid if the list is for subscribers only (i.e. does not allow contacts)	Bool
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
	DistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object to which this distribution list member belongs.	ObjectID
	MemberContactObjectId	char (36 characters)	The member of this distribution list. If the member is a contact, the unique identifier of the Contact object that is a member of the distribution list. Otherwise, this attribute is set to NULL.	ObjectID
PK	MemberUserObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DistributionListMember object.	ObjectID

Stored Procedures

vw_DistributionListMemberTemplate has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AllowForeignMessage

Property Name	Value
Description:	Controls if we allow foreign message systems to send to this particular distribution list. Only valid if the list is for subscribers only (i.e. does not allow contacts)
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionList.AllowForeignMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns. If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DistributionListObjectId

Property Name	Value
Description:	The unique identifier of the DistributionList object to which this distribution list member belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.DistributionListObjectId
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	ObjectID

Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.73. vw_DtmfAccessId

A simple view for tbl_DtmfAccessId.

A dialable number (i.e. extension) for all subscribers, call handlers, interview handlers, directory handlers, location objects and distribution lists in the entire system.

Additional Information

The tbl_DtmfAccessId table serves a couple of very important roles. When you go to add a new subscriber, handler, etc. you need to make sure it does not conflict with a DtmfAccessId at the Dialing Domain scope. This table provides an easy way of doing that with a single query instead of having to check several tables individually. When conversations are collecting a DtmfAccessId from the caller for addressing a message by extension or for doing an auto attendant DtmfAccessId lookup or the like, the lookups for a match have to be done against this single table instead of using a complex multi table search.

Administrator defined alternate extensions for subscribers are also stored in this table. In addition to the primary extension assigned to a subscriber, a subscriber can have up to 9 alternate extension numbers that administrators can specify. For example, if a subscriber has multiple line appearances on their phone. Alternate extensions have an IdIndex with a non-zero value. All alternate extensions use the same transfer setting settings as the primary extension.

User defined "alternate extensions" are subscriber phone numbers used to facilitate auto-logon when a subscriber calls from a home, mobile, or other phone number. These phone numbers are stored in the tbl_PhoneNumber table, which has an "AutoLogon" column that can set to use a number for autologon. This keeps these numbers out of the global DtmfAccessId space, and keeps them from being used for addressing, which is desirable. DtmfAccessId's are used for both auto-logon and addressing.

For Cisco Unity Connection, SIP format extensions are not allowed in system-defined extensions (primary and administrator-defined alternate extensions) . A system-defined extension must contain an extension in the format of a telephone numeric (digits 0-9 only) while a user-defined alternate extension stored in tbl_PhoneNumber can contain either a number or an alias for a SIP URL.

When Cisco Unity Connection supports multiple VMS servers, this table will also contain subscriber and location extensions from other VMS servers on the network. Call handlers and interview handlers are local objects only and are not replicated around the directory so the DtmfAccessId table will only have IDs from local objects in that case.

Cisco Unity Connection does not have the concept of a "dialing domain", which was used primarily in networking to allow more than one Unity to be part of the same dialing domain. Cisco Unity Connection does not support networking, and hence this is not needed.

If we go forward with support for multiple primary locations in subsequent versions, then these may be used to partition the DtmfAccessId space for multiple tenants (for example), since the current model supports having the same DtmfAccessId at more than one primary location.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallPickupTimeout	smallint (2 bytes)	The number of rings that Cisco Unity Connection will wait for a subscriber destination to answer before the call is forwarded to the next destination in the destination group.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	ClientMatterCode	varchar (40 characters)	The Client Matter Code (CMS) to transmit to Call Manger when the phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign account or billing codes to the call.	ClientMatter-Code
	DisplayName	nvarchar (64 characters)	The text name of this DtmfAccessId to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	IdIndex	int (4 bytes)	An index into the alternate extensions for a subscriber.	
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this location (denormalized) belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DtmfAccessId object.	ObjectID
	Parent_ContactObjectId	char (36 characters)	The unique identifier of the Contact object to which this DtmfAccessId belongs.	ObjectID
	Parent_DistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object to which this DtmfAccessId belongs	ObjectID
	Parent_HandlerObjectId	char (36 characters)	The unique identifier of the Handler object to which this DtmfAccessId belongs	ObjectID
	Parent_LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this DtmfAccessId belongs,	ObjectID
	Parent_SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this DtmfAccessId belongs	ObjectID
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicating whether an authorization code should be transmitted to Call Manager after this number is dialed during an outbound call.	Bool

Stored Procedures

Name	Description
csp_DtmfAccessIdCreate	Creates a new DtmfAccessId object (extension number) for a subscriber (primary and alternate extension), call handler, interview handler, directory handler, location, contact, or distribution list by inserting a new row into tbl_DtmfAccessId.
csp_DtmfAccessIdDelete	Deletes a DtmfAccessId object (extension number) from tbl_DtmfAccessId as specified by the @ObjectId parameter.
csp_DtmfAccessIdModify	Updates the attributes of a DtmfAccessId (extension) object for a subscriber (primary and alternate extension), call handler, interview handler, directory handler, location, contact, or distribution list based on the values passed in via the parameters. The @ObjectId parameter identifies the DtmfAccessId object that will be updated.

Column Properties

CallPickupTimeout

Property Name	Value
Description:	The number of rings that Cisco Unity Connection will wait for a subscriber destination to answer before the call is forwarded to the next destination in the destination group.
Notes:	The call is pulled back by the PA and the routed to the next PA destination.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.CallPickupTimeout
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The Client Matter Code (CMS) to transmit to Call Manger when the phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign account or billing codes to the call.
Notes:	
Business Rules:	A NULL indicates that a CMC is not required.
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of this DtmfAccessId to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	Used to "name" alternate extension slots such that they are displayed in administrative interfaces such as in PCA slots with those defined names such as mobile phone, home phone, etc. Currently, the ability to assign a name or label to an alternate extension is only implemented in PCA for subscriber defined alternate extensions. This column was formerly named "Description" in Unity 4.x.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters

Property Name	Value
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ \% \?\\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IdIndex

Property Name	Value
Description:	An index into the alternate extensions for a subscriber.
Notes:	<p>Differentiates extensions for a single user. This column replaces the "Alias" column in Cisco Unity Connection 4.0. as an index into a subscriber alternate extension.</p> <p>Cisco Unity Connection allows a subscriber to have 9 administrator specified alternate extensions and 5 subscriber defined (if allowed by COS) alternate extensions. A particular alternate extension can be located in this table by using the IdIndex. Non alternate extensions (subscriber primary, distribution list, location, etc.) have an IdIndex containing a value of 0.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.IdIndex
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10

LocationObjectId

Property Name	Value
Description:	The unique identifier of the Location object to which this location (denormalized) belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.LocationObjectId
Primary Key:	False
Allow Null:	False

TransmitForcedAuthorizationCode

Property Name	Value
Description:	A flag indicating whether an authorization code should be transmitted to Call Manager after this number is dialed during an outbound call.
Notes:	
Business Rules:	
Developer Notes:	In the future, we should be able to grab this setting from Call Manager via AXL.
Table/Column Mapping:	tbl_DtmfAccessId.TransmitForcedAuthorizationCode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.74. vw_ExternalService

External service such as IMAP, WebDAV, or MeetingPlace Express.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DialString	nvarchar (40 characters)	The number dialed by Unity Connection to access the Cisco Unified MeetingPlace Express system.	PhoneNumberE123
	DisplayName	nvarchar (64 characters)	The preferred text name of the external service used when displaying entries such as in the administrative console, e.g., Cisco Unity Connection Administrator.	
	IsEnabled	smallint (2 bytes)	A flag indicating whether the external service is enabled.	Bool
	Mounted	smallint (2 bytes)	***Obsolete - use IsEnabled instead ***	Bool
PK	ObjectId	char (36 characters)	A globally unique, system-generated identifier for a external service object.	ObjectID
	RequiredSecurity	int (4 bytes)	The method of encryption that Cisco Unity Connection will use on the connection with this external service.	MailstoreConnectionEncryption
	Server	lvarchar (256 characters)	The name of the server on which the external service runs.	
	ServiceAlias	lvarchar (256 characters)	The unique text name (e.g., logon name) for a service to use to logon to the external service.	
	ServicePassword	varchar (254 characters)	The password for logon to the external service.	
	ServiceType	int (4 bytes)	The type of external service (e.g., WebDAV, IMAP, MPE).	MailboxStoreType
	UseServiceCredentials	smallint (2 bytes)	A flag indicating whether to use service credentials rather than user credentials to logon to the external service.	Bool

Stored Procedures

Name	Description
csp_ExternalServiceCreate	Creates a new external service object by inserting a new row into tbl_MailboxStoreMap.

Name	Description
csp_ExternalServiceDelete	Deletes an External Service by deleting a MailboxStoreMap object from tbl_MailboxStoreMap as specified by the @ObjectId parameter.
csp_ExternalServiceModify	Updates the attributes of a External Service by updating a MailboxStoreMap object based on the values passed in via the parameters. The @ObjectId parameter identifies the MailboxStoreMap object that is updated.

Column Properties

DialString

Property Name	Value
Description:	The number dialed by Unity Connection to access the Cisco Unified MeetingPlace Express system.
Notes:	Valid only for a MeetingPlace Express external service.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.DialString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of the external service used when displaying entries such as in the administrative console, e.g., Cisco Unity Connection Administrator.
Notes:	
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_MailboxStoreMap.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:

SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsEnabled

Property Name	Value
Description:	A flag indicating whether the external service is enabled.
Notes:	Values: 0: The external service is disabled. 1: The external service is enabled.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Mounted
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Mounted

Property Name	Value
Description:	***Obsolete - use IsEnabled instead ***
Notes:	Clients should check this setting before accessing the mailbox store database. Tools can set it to denote that a mailbox store is offline when offline database maintenance needs to be performed.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Mounted
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	A globally unique, system-generated identifier for a external service object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiredSecurity

Property Name	Value
Description:	The method of encryption that Cisco Unity Connection will use on the connection with this external service.
Notes:	Values: 0: No encryption. 1: TLS level encryption. 2: SSL encryption. 3: IPSec encryption.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.RequiredSecurity
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailstoreConnectionEncryption
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Server

Property Name	Value
Description:	The name of the server on which the external service runs.
Notes:	For WebDAV, this is the base URL such as http://exchange.mycompany.com, or https://exchange.mycompany.com, or https://exchange.mycompany.com:443, etc. - essentially it is extended to allow controlling the security and port.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Server
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (256 characters)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ServiceAlias

Property Name	Value
Description:	The unique text name (e.g., logon name) for a service to use to logon to the external service.
Notes:	Must have access to all users messages ("superuser").
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ServiceAlias

5.75. vw_Greeting

A rule that for each call handler, defines which greetings are enabled, the greeting source, and the actions that Cisco Unity Connection takes during and after each greeting. Formerly referred to as "Messaging Rules."

Additional Information

This view is comprised of all the columns in tbl_Greeting, plus two additional columns - Greeting and LanguageCode. Greeting is defined in tbl_StreamFile.FileName and LanguageCode is defined in tbl_StreamFile.LanguageCode.

Each call handler has a collection of six greetings:

Standard: Plays at all times unless overridden by another greeting. You cannot disable the standard greeting.

Off Hours: Plays during the closed (nonbusiness) hours defined for the active schedule. An off hours greeting overrides the standard greeting, and thus limits the standard greeting to the open hours defined for the active schedule.

Internal: Plays to internal callers only. An internal greeting overrides the standard and off hours greetings.

Busy: Plays when the extension is busy. A busy greeting overrides the standard, off hours, and internal greetings.

Alternate: Can be used for a variety of special situations, such as vacations, leave of absence, or a holiday. An alternate greeting overrides all other greetings.

Error: Plays when a caller attempts to dial an extension that does not exist on the system during a greeting.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterGreeting_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterGreeting_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterGreeting_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
PK	CallHandlerObjectId	char (36 characters)	The unique identifier of the CallHandler object to which this greeting rule belongs.	ObjectID
PK	GreetingType	nvarchar (12 characters)	The type of greeting, e.g. "Standard," "Off Hours," "Busy," etc.	GreetingRule-Name
	IgnoreDigits	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection takes action in response to touchtone keys pressed by callers during the greeting.	Bool
	PlayWhat	smallint (2 bytes)	The source for the greeting when this greeting is active.	PlayWhat-Type
	RepromptDelay	smallint (2 bytes)	The amount of time (in seconds) that Cisco Unity Connection waits without receiving any input from a caller before Cisco Unity Connection prompts the caller again.	
	Reprompts	smallint (2 bytes)	The number of times to reprompt a caller. After the number of times indicated here, Cisco Unity Connection performs the after-greeting action.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	TimeExpires	datetime (8 bytes)	The date and time when the greeting rule expires. The greeting rule is considered not expired (enabled), if the value is NULL or a future date. The greeting rule is considered expired (disabled), the value is in the past.	

Stored Procedures

Name	Description
csp_GreetingCreate	Creates a new Greeting object for a call handler by inserting a new row into tbl_Greeting.
csp_GreetingDelete	Deletes one of the six standard greetings for a call handler from tbl_Greeting as specified by the @CallHandlerObjectId and @GreetingType ("Standard", "Off Hours", etc.) parameters.
csp_GreetingModify	Modifies one of the six standard greetings for a call handler. The attributes of a Greeting object are updated based on the values passed in via the parameters. The @GreetingType and @CallHandlerObjectId parameter identify the Greeting object that is updated.

Column Properties

AfterGreeting_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:

AfterGreeting_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

IgnoreDigits

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection takes action in response to touchtone keys pressed by callers during the greeting.
Notes:	<p>This column overrides all Menu Entry settings when this greeting is active. This has the same effect as setting all the menu entry keys for this handler to "locked". It's a shorthand way of locking callers into the greeting so they can't get out until it completes.</p> <p>Values: 0: Caller input enabled during greeting 1: Caller input ignored during greeting</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.IgnoreDigits
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PlayWhat

Property Name	Value
Description:	The source for the greeting when this greeting is active.
Notes:	<p>Values:</p> <p>0: System greeting - Cisco Unity Connection plays a prerecorded greeting along with the recorded name of the subscriber (for example, "Sorry, <subscriber name> is not available"). If the subscriber does not have a recorded name, Cisco Unity Connection plays the subscriber extension instead. When a greeting is enabled but not recorded, Cisco Unity Connection plays a prerecorded system greeting.</p> <p>1: Recorded greeting - use a personal recording for the call handler (or subscriber). This can be recorded over the phone or from the Cisco Unity Connection Administration and CPCA administrative interfaces on the call handler/subscriber.</p> <p>2: No greeting is played.</p>
Business Rules:	<p>Default values:</p> <p>Call handler - 1 (recording)</p> <p>Subscriber - 0 (system)</p>
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.PlayWhat
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	PlayWhatType
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RepromptDelay

Property Name	Value
Description:	The amount of time (in seconds) that Cisco Unity Connection waits without receiving any input from a caller before Cisco Unity Connection prompts the caller again.
Notes:	<p>Values:</p> <p>0: Do wait without receiving caller input and do not replay greeting.</p> <p>1 or greater - Wait this number of seconds without receiving any input from the caller before playing the greeting again.</p>
Business Rules:	If reprompt is enabled, a default value of 2 seconds is recommended.
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.RepromptDelay
Primary Key:	False
Allow Null:	False
Default Value:	2

Property Name	Value
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

Reprompts

Property Name	Value
Description:	The number of times to reprompt a caller. After the number of times indicated here, Cisco Unity Connection performs the after-greeting action.
Notes:	<p>This column is typically used when an audio text application is expecting input from a caller.</p> <p>Values:</p> <p>0: Do not reprompt - Cisco Unity Connection will play the greeting once and then the after-greeting action is taken.</p> <p>1 or greater: Number of times to reprompt.</p> <p>The "RepromptDelay" value determines how many seconds to wait in between replays.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.Reprompts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

TimeExpires

Property Name	Value
Description:	The date and time when the greeting rule expires. The greeting rule is considered not expired (enabled), if the value is NULL or a future date. The greeting rule is considered expired (disabled), the value is in the past.
Notes:	<p>Rather than use a simple on and off scheme for enabling greetings and transfer options, Cisco Unity Connection employs a date scheme. If the value is NULL or a date in the future then the greeting is considered enabled. If the date is sometime in the past, then the greeting is considered disabled.</p> <p>The "Enhanced Alternate Greeting" feature uses this column to specify how long the subscriber wants their alternate greeting enabled.</p> <p>The standard greeting rule should never be disabled.</p>
Business Rules:	
Developer Notes:	The date scheme concept was intended to support the capability of automatically expiring greetings and transfers, however that feature was never actually implemented.
Table/Column Mapping:	tbl_Greeting.TimeExpires
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:

IgnoreDigits

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection takes action in response to touchtone keys pressed by callers during the greeting.

Property Name	Value
Notes:	<p>This column overrides all Menu Entry settings when this greeting is active. This has the same effect as setting all the menu entry keys for this handler to "locked". It's a shorthand way of locking callers into the greeting so they can't get out until it completes.</p> <p>Values: 0: Caller input enabled during greeting 1: Caller input ignored during greeting</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.IgnoreDigits

LanguageCode

Property Name	Value
Description:	The language code (LCID) indicating the language of the text in the LocalizedName column.

Property Name	Value
Notes:	<p>The Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063 1065: Farsi 1065 1066: Vietnamese 1066 1067: Armenian 1067 1068: Azeri_Latin 1068 1069: Basque 1069 1070: Sorbian 1070 1071: Macedonian 1071 1072: Sutu 1072 1073: Tsonga 1073</p>

PlayWhat

Property Name	Value
Description:	The source for the greeting when this greeting is active.
Notes:	<p>Values:</p> <p>0: System greeting - Cisco Unity Connection plays a prerecorded greeting along with the recorded name of the subscriber (for example, "Sorry, <subscriber name> is not available"). If the subscriber does not have a recorded name, Cisco Unity Connection plays the subscriber extension instead. When a greeting is enabled but not recorded, Cisco Unity Connection plays a prerecorded system greeting.</p> <p>1: Recorded greeting - use a personal recording for the call handler (or subscriber). This can be recorded over the phone or from the Cisco Unity Connection Administration and CPCA administrative interfaces on the call handler/subscriber.</p> <p>2: No greeting is played.</p>
Business Rules:	<p>Default values:</p> <p>Call handler - 1 (recording)</p> <p>Subscriber - 0 (system)</p>
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.PlayWhat
Primary Key:	False
Allow Null:	False

RepromptDelay

Property Name	Value
Description:	The amount of time (in seconds) that Cisco Unity Connection waits without receiving any input from a caller before Cisco Unity Connection prompts the caller again.
Notes:	Values: 0: Do wait without receiving caller input and do not replay greeting. 1 or greater - Wait this number of seconds without receiving any input from the caller before playing the greeting again.
Business Rules:	If reprompt is enabled, a default value of 2 seconds is recommended.
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.RepromptDelay
Primary Key:	False
Allow Null:	False
Default Value:	2
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

Reprompts

Property Name	Value
Description:	The number of times to reprompt a caller. After the number of times indicated here, Cisco Unity Connection performs the after-greeting action.
Notes:	This column is typically used when an audio text application is expecting input from a caller. Values: 0: Do not reprompt - Cisco Unity Connection will play the greeting once and then the after-greeting action is taken. 1 or greater: Number of times to reprompt. The "RepromptDelay" value determines how many seconds to wait in between replays.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Greeting.Reprompts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

TimeExpires

Property Name	Value
Description:	The date and time when the greeting rule expires. The greeting rule is considered not expired (enabled), if the value is NULL or a future date. The greeting rule is considered expired (disabled), the value is in the past.
Notes:	<p>Rather than use a simple on and off scheme for enabling greetings and transfer options, Cisco Unity Connection employs a date scheme. If the value is NULL or a date in the future then the greeting is considered enabled. If the date is sometime in the past, then the greeting is considered disabled.</p> <p>The "Enhanced Alternate Greeting" feature uses this column to specify how long the subscriber wants their alternate greeting enabled.</p> <p>The standard greeting rule should never be disabled.</p>
Business Rules:	
Developer Notes:	The date scheme concept was intended to support the capability of automatically expiring greetings and transfers, however that feature was never actually implemented.
Table/Column Mapping:	tbl_Greeting.TimeExpires
Primary Key:	False
Allow Null:	True
Default Value:	NULL

5.77. vw_GreetingStreamFile

A simple view for tbl_GreetingStreamFile.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	CallHandlerObjectId	char (36 characters)	The unique identifier of the CallHandler object to which the stream file belongs.	ObjectID
PK	GreetingType	nvarchar (12 characters)	The type of greeting (e.g., alternate) to which the stream file belongs.	GreetingRule-Name
PK	LanguageCode	int (4 bytes)	The Windows Locale ID (LCID) identifying the language in which this stream was recorded.	Language-Code
	StreamFile	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_GreetingStreamFileCreate	Creates a new GreetingStreamFile object in the specified language for a call handler by inserting a new row into tbl_GreetingStreamFile.
csp_GreetingStreamFileDelete	Deletes a GreetingStreamFile object from tbl_GreetingStreamFile as specified by the combination of the @CallHandlerObjectId, @GreetingType, and @LanguageCode parameters. The StreamFile object in tbl_StreamFile associated with the GreetingStreamFile is also deleted by the procedure.
csp_GreetingStreamFileModify	Updates the attributes of a GreetingStreamFile object based on the values passed in via the parameters. The combination of the @CallHandlerObjectId, @GreetingType, and @LanguageCode parameters identify the GreetingStreamFile object that is updated. The StreamFile object in tbl_StreamFile as specified by @StreamFile is also updated.

Column Properties

CallHandlerObjectId

Property Name	Value
Description:	The unique identifier of the CallHandler object to which the stream file belongs.
Notes:	This is provides Cisco Unity Connection with an easy way to discover what object a stream belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_GreetingStreamFile.CallHandlerObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

GreetingType

Property Name	Value
Description:	The type of greeting (e.g., alternate) to which the stream file belongs.
Notes:	<p>Combined with CallHandlerObjectId, this facilitates finding the parent Greeting.</p> <p>Values:</p> <p>Alternate: Alternate - can be used for a variety of special situations, such as vacations, leave of absence, or a holiday. An alternate greeting overrides all other greetings.</p> <p>Busy: Busy - plays when the extension is busy. A busy greeting overrides the standard, off hours, and internal greetings.</p> <p>Error: Error - plays when a caller attempts to dial an extension that does not exist on the system during a greeting.</p> <p>Holiday: Holiday - plays when holiday schedule is encountered unless overridden by an alternate greeting.</p> <p>Internal: Internal - plays to internal callers only. An internal greeting overrides the standard and off hours greetings.</p> <p>Off Hours: Off hours - plays during the closed (nonbusiness) hours defined for the active schedule. An off hours greeting overrides the standard greeting, and thus limits the standard greeting to the open hours defined for the active schedule.</p> <p>Standard: Standard - plays at all times unless overridden by another greeting. You cannot disable the standard greeting.</p>
Business Rules:

LanguageCode

Property Name	Value
Description:	The Windows Locale ID (LCID) identifying the language in which this stream was recorded.

Property Name	Value
Notes:	<p>The usage of this column permits recording greetings and perhaps other voice recordings in multiple languages.</p> <p>The language is stored as a LCID, for example 1033 for US English. See custom type LanguageCode for additional information.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241</p> <p>10249: English_Belize 10249</p> <p>1025: Arabic_Saudi_Arabia 1025</p> <p>10250: Spanish_Peru 10250</p> <p>1026: Bulgarian 1026</p> <p>1027: Catalan 1027</p> <p>1028: Chinese_Taiwan 1028</p> <p>1029: Czech 1029</p> <p>1030: Danish 1030</p> <p>1031: German_Standard 1031</p> <p>1032: Greek 1032</p> <p>1033: English_United_States 1033</p> <p>1034: Spanish_Traditional_Sort 1034</p> <p>1035: Finnish 1035</p> <p>1036: French_Standard 1036</p> <p>1037: Hebrew 1037</p> <p>1038: Hungarian 1038</p> <p>1039: Icelandic 1039</p> <p>1040: Italian_Standard 1040</p> <p>1041: Japanese 1041</p> <p>1042: Korean 1042</p> <p>1043: Dutch_Standard 1043</p> <p>1044: Norwegian_Bokmal 1044</p> <p>1045: Polish 1045</p> <p>1046: Portuguese_Brazilian 1046</p> <p>1047: Rhaeto-Romanic 1047</p> <p>1048: Romanian 1048</p> <p>1049: Russian 1049</p> <p>1050: Croatian 1050</p> <p>1051: Slovak 1051</p> <p>1052: Albanian 1052</p> <p>1053: Swedish 1053</p> <p>1054: Thai 1054</p> <p>1055: Turkish 1055</p> <p>1056: Urdu 1056</p> <p>1057: Indonesian 1057</p> <p>1058: Ukrainian 1058</p> <p>1059: Belarusian 1059</p> <p>1060: Slovenian 1060</p> <p>1061: Estonian 1061</p> <p>1062: Latvian 1062</p> <p>1063: Lithuanian 1063</p> <p>1065: Farsi 1065</p> <p>1066: Vietnamese 1066</p> <p>1067: Armenian 1067</p> <p>1068: Azeri_Latin 1068</p> <p>1069: Basque 1069</p> <p>1070: Sorbian 1070</p>

5.78. vw_Handler

A base table for all type of handler objects such as call handler, interview handler and directory handler (formerly referred to as "name lookup handler").

Additional Information

This view is comprised of all the columns in the tbl_Handler table, plus an additional column VoiceName that is defined in tbl_StreamFile.FileName.

A handler contains those properties common to all types of "handlers."

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Handler object.	ObjectID
	ObjectType	smallint (2 bytes)	The type of handler (CallHandler, InterviewHandler, or DirectoryHandler) for this object.	ObjectType
	Undeleteable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

vw_Handler has no stored procedures.

Column Properties

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If you choose Inherited, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Validation - Maximum Value:	

ObjectType

Property Name	Value
Description:	The type of handler (CallHandler, InterviewHandler, or DirectoryHandler) for this object.

Property Name	Value
Notes:	<p>Having the type here is mainly for efficiency - it would be possible to query the other tables to find which had this same object id, but that is more expensive.</p> <p>Values:</p> <p>0: Reserved - not assigned to an object.</p> <p>1: User account type.</p> <p>10: Template for creating a new user.</p> <p>100: Group owned by a Unity user.</p> <p>102: Personal address book type information for persons who are not Unity voice mail users.</p> <p>103: System call routing rule.</p> <p>11: Credential (i.e., password) policy for user accounts.</p> <p>12: A table containing a list of phone numbers subscribers can use for transferring calls, recording and playback by phone from Cisco Unity Connection applications, delivering faxes to a fax machine, and sending message notifications.</p> <p>13: A collection of privileges that control administrative access to the system.</p> <p>14: Discrete rights granted to perform an operation on a type of resource.</p> <p>15: Grants a user a Role in a particular area.</p> <p>16:</p> <p>17: Associates a user as a member of a system PDL.</p> <p>18:</p> <p>19:</p> <p>2: System distribution list.</p> <p>20: Unknown object type.</p> <p>21: User that has a subscription to a voice mail service and as such also is assigned at least one mailbox.</p> <p>22: A user in a remote mail system.</p> <p>3: CallHandler</p> <p>5: Special case call handler that asks the caller up to 20 questions.</p> <p>6: Directory Handler used to search a subset of the directory. Formerly referred to as "NameLookupHandler."</p> <p>64: Holds members of a voice mail user's private distribution list.</p> <p>65: Transfer rule for contacting a voice mail user. Formerly referred to as "Contact Rule."</p> <p>66: Defines the greeting to play and the action to take for a call handler. Formerly referred to as "Messaging Rule."</p> <p>67: Touch-tone menu entry for a call handler.</p> <p>68: The number or number pattern to be locked or allowed in Restriction table.</p> <p>69: A question associated with an interview handler.</p> <p>7: A schedule.</p> <p>70: Special type of notification device used to set/clear message waiting indication on phone.</p> <p>71: Set of parameters for phone, fax or pager for notification of new messages.</p> <p>72: Specifies when and which notification device is used for notification of a new message.</p> <p>8: Class of service.</p> <p>9:</p> <p>95: VPIM location.</p> <p>97: Bridge location.</p> <p>98: AMIS location.</p> <p>99: A Virtual Messaging System (VMS) location.</p>

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.Undeletable

Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage

Validation - Maximum Length:	40 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

5.79. vw_HandlerReference

Returns references to handlers from other objects.

Additional Information

The intended use is with a "WHERE ObjectId=xxx" clause, to search for references to a particular handler.

This view is used by CUSA when deleting a user for reference substitution.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	Display name of object that references the handler.	DisplayName
PK	ObjectId	char (36 characters)	Unique identifier of the handler that is referenced by an object.	ObjectID
	ReferenceType	nvarchar (24 characters)	Type of reference (e.g., After Greeting, After Message, etc.)	Subscriber-Reference-Type
	ReferrerObjectId	char (36 characters)	Unique identifier of the object that refers to the handler identified by the ObjectId column.	ObjectID
	ReferrerObjectType	smallint (2 bytes)	Type of the object that refers to this handler.	ObjectType

Stored Procedures

5.80. vw_InstalledLanguage

A simple view for tbl_InstalledLanguage.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	IsLicensed	smallint (2 bytes)	A derived column that tells if a language is licensed on this box. "1" for yes and "0" for no.	Bool
PK	LanguageCode	int (4 bytes)	The Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.	Language-Code
PK	LanguageType	int (4 bytes)	The type of language (TUI, GUI, etc.)	Language-Type
	Loaded	smallint (2 bytes)	A flag indicating whether this language is loaded at run time.	Bool

Stored Procedures

Name	Description
csp_InstalledLanguageCreate	Creates a new InstalledLanguage object by inserting a new row into tbl_InstalledLanguage.
csp_InstalledLanguageDelete	Deletes a InstalledLanguage object from tbl_InstalledLanguage as specified by the combination of the @LanguageCode and @LanguageType parameters.
csp_InstalledLanguageModify	Updates the attributes of an InstalledLanguage object based on the values passed in via the parameters. The @LanguageCode and @LanguageType parameters identify the InstalledLanguage object that will be updated.

Column Properties

IsLicensed

Property Name	Value
Description:	A derived column that tells if a language is licensed on this box. "1" for yes and "0" for no.

Property Name	Value

5.81. vw_InterviewHandler

A type of Handler object that collects information from callers by playing a series of questions that have been recorded, and then recording the answers offered by callers.

Additional Information

This view is comprised of the columns in the tbl_Handler and tbl_InterviewHandler tables.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AfterMessage_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	AfterMessage_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	AfterMessage_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	AfterMessageCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection performs after an unidentified caller leaves a message for an interview handler.	ObjectID
	CreationTime	datetime (8 bytes)	The date and time the handler is created.	
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	Language	int (4 bytes)	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.	Language-Code
	LocationObjectId	char (36 characters)	The unique identifier of the Location object to which this handler belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generate identifier for a InterviewHandler object.	ObjectID
	Recipient_DistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object where the recorded message of the interview handler should be routed.	ObjectID
	Recipient_SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object where the recorded message of the interview handler should be routed.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	SendUrgentMsg	smallint (2 bytes)	A flag indicating whether an unidentified caller is given a choice to mark a message as Urgent or Normal, or if not given the choice, whether the message is always marked Normal (default value) or Urgent.	SendUrgentInterviewMsg
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that contains the voice file name for this handler.	ObjectId
	Undeletable	smallint (2 bytes)	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this interview handler is derived from the interview handler object attribute or the default language from the location to which the interview handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_InterviewHandlerCreate	Creates a new InterviewHandler object by inserting a new row into tbl_InterviewHandler. This procedure also creates several other objects: * The after message action by inserting a new row into tbl_CallAction * A new handler by inserting a new row into tbl_Handler * Twenty empty interview handler questions by inserting 20 new rows into tbl_InterviewHandlerQuestion * If provided, a new DtmfAccessId by inserting a new row into tbl_DtmfAccessId * If provided, a new voice name for the interview handler by activating an existing StreamFile object in tbl_StreamFile that was allocated using csp_AllocateVoiceFile.
csp_InterviewHandlerDelete	Deletes an InterviewHandler object from tbl_InterviewHandler as specified by the @ObjectId parameter. This procedure also deletes several objects related to an InterviewHandler object: * The parent Handler object is deleted from tbl_Handler. (The FK cascade delete will actually delete the InterviewHandler along with all InterviewHandlerQuestions assigned to the InterviewHandler.) * The associated aftermessageaction is deleted from tbl_CallAction. * If there is an extension number assigned to the InterviewHandler, the related DtmfAccessId object is deleted from tbl_DtmfAccessId. * If the InterviewHandler has a recorded voice name, the related StreamFile object is deleted from tbl_StreamFile by executing csp_StreamFileDelete.

Name	Description
csp_InterviewHandlerModify	Updates the attributes of an InterviewHandler object based on the values passed in via the parameters. The @ObjectId parameter identifies the InterviewHandler object that will be updated. This procedure will also update the AfterMessageAction, DtmfAccessId and VoiceName, if the parameters are passed in. See notes for additional information.

Column Properties

AfterMessage_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessage_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterMessageCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that Cisco Unity Connection performs after an unidentified caller leaves a message for an interview handler.
Notes:	This value references a tbl_CallAction->ObjectId. Possible actions are: <ul style="list-style-type: none"> * Say good-bye * Send caller to another call handler * Send caller to a directory handler * Send caller to an interview handler * Send caller to a greetings administrator * Send caller to sign-in i.e., subscriber logon conversation * Hang-up * Send caller to a subscriber * Send caller to a subscriber system transfer
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewHandler.AfterMessageCallActionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the handler is created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_Handler.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-\.\@\,\;\+\ \%\?'\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The Windows Locale ID (LCID) which identifies the language that Cisco Unity Connection plays the handler system prompts.

Property Name	Value
Notes:	<p>This is the Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>A value of NULL means the language is inherited. If inherited is selected, Cisco Unity Connection determines the language to use for system prompts on a per-call basis, depending on the handler or routing rule that processed the call. If the language is set to Inherited for every rule and handler that processes a call, then the system prompts are played in the default phone language. For instance, if the call came in and hit an opening greeting that was set to 1033 for US English, that call is considered US English until it hits another object in the database that has a language setting other than NULL for inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063</p>

Validation - Maximum Value:	

Recipient_SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object where the recorded message of the interview handler should be routed.
Notes:	
Business Rules:	Only one Recipient_ column may be filled in.
Developer Notes:	
Table/Column Mapping:	tbl_InterviewHandler.Recipient_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SendUrgentMsg

Property Name	Value
Description:	A flag indicating whether an unidentified caller is given a choice to mark a message as Urgent or Normal, or if not given the choice, whether the message is always marked Normal (default value) or Urgent.
Notes:	Values: 0: Normal - interview messages left by unidentified calls are always marked normal. 1: Urgent - all interview messages left by unidentified calls are always marked urgent. 2: Ask - Cisco Unity Connection asks unidentified callers whether to mark their interview messages normal or urgent.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewHandler.SendUrgentMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	SendUrgentInterviewMsg
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that contains the voice file name for this handler.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	A flag indicating whether this handler can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Used to prevent the deletion of factory defaults such as the "Opening Greeting" call handler. 0: The handler can be deleted by an administrator (with the required privilege) via an administrative application such as Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager. 1: The handler cannot be deleted by an administrator via Cisco Unity Connection Administration or Cisco Unity Connection Bulk Administration Manager.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_Handler.Undeletable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag allows that language to be the language used by handlers in the system to play prompts for users. Values: 0: Do not use the language specified by the system call routing rule to play prompts for users 1: Use the language specified by the system call routing rule to play prompts for users
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this interview handler is derived from the interview handler object attribute or the default language from the location to which the interview handler belongs. Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via url, but the url-path is constructed from the filename dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

5.82. vw_InterviewHandler_List

A narrow view of a interview handler. This view provides a list of all interview handlers, which is used by CUSA to provide list of interview handlers in drop-down lists. It contains only the ObjectId and DisplayName for each interview handler.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generate identifier for a InterviewHandler object.	ObjectID

Stored Procedures

vw_InterviewHandler_List has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generate identifier for a InterviewHandler object.
Notes:	The value of this objectId is the same as the objectId of its associated base object in tbl_Handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewHandler.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.83. vw_InterviewHandlerQuestion

A simple view for tbl_InterviewQuestion.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	InterviewHandlerObject-Id	char (36 characters)	The unique identifier of the InterviewHandler object to which this interview question belongs.	ObjectID
	IsActive	smallint (2 bytes)	A flag indicating whether the question is used.	Bool
	MaxMsgLength	smallint (2 bytes)	The maximum recording length (in seconds) allowed for caller responses to the question.	
PK	QuestionNumber	smallint (2 bytes)	The interview question number. Questions are numbered from 1 to 20.	
	StreamText	lvarchar (256 characters)	The complete text of the question used for display purposes.	
	VoiceFile	varchar (40 characters)		FileNameGuid

Stored Procedures

Name	Description
csp_InterviewHandlerQuestionModify	Updates the attributes of an InterviewHandlerQuestion object based on the values passed in via the parameters. The combination of the @InterviewHandlerObjectId and @QuestionNumber parameters identify the InterviewHandlerQuestion object that will be updated. This procedure will also update the VoiceFile (StreamFile object), if the parameter @VoiceFile is passed in.

Column Properties

InterviewHandlerObjectId

Property Name	Value
Description:	The unique identifier of the InterviewHandler object to which this interview question belongs.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewQuestion.InterviewHandlerObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActive

Property Name	Value
Description:	A flag indicating whether the question is used.
Notes:	Values: 0: The question is not in use or not recorded and should not be played. 1: The question is active and will be used.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewQuestion.IsActive
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxMsgLength

Property Name	Value
Description:	The maximum recording length (in seconds) allowed for caller responses to the question.
Notes:	If enabled, a warning tone will sound before the maximum message length is reached.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewQuestion.MaxMsgLength
Primary Key:	False
Allow Null:	False
Default Value:	30
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

QuestionNumber

Property Name	Value
Description:	The interview question number. Questions are numbered from 1 to 20.
Notes:	A sequential index for this object within the particular interview handler.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewQuestion.QuestionNumber
Primary Key:	True
Allow Null:	False
Default Value:	1
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	20

StreamText

Property Name	Value
Description:	The complete text of the question used for display purposes.
Notes:	Defaults to the index ("1", "2", etc.)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_InterviewQuestion.StreamText
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceFile

Property Name	Value
Description:	
Notes:	
Business Rules:

Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.84. vw_IpAddressAccessList

Simple view for tbl_IpAddressAccessList table.

An IP address or group of IP addresses that is allowed to connect to the SMTP server. The SMTP server can be configured to: allow connections from any IP address, deny connections from any IP address, allow connections from an explicit IP address or group of IP addresses, or to allow connections from all IP addresses EXCEPT those explicitly specified to deny.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Address	varchar (40 characters)	Either the IP address for a single machine, a subnet address for a group of machines, or all addresses in the IPv4 address range (signified by "*"). The address may be in the format of IPv4, IPv4 CIDR (Classless Inter-Domain Routing) , or an asterisk ("*") character which means all IP addresses in the IPv4 range.	
	AllowConnection	smallint (2 bytes)	A flag indicating whether the SMTP server to which this row belongs, will allow or deny connections from this IP address/group of IP addresses. Values: 0: Deny connections from this IP address/group of IP addresses 1: Allow connections from this IP address/group of IP addresses (default)	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a IPAddressRestriction object.	ObjectID
	SmtpServerObjectId	char (36 characters)	The unique identifier of the SMTPServer to which this IP address belongs. A Foreign Key to tbl_SmtpServer.ObjectId.	ObjectID

Stored Procedures

Name	Description
csp_IpAddressAccessListCreate	Create an entry in the access list that will allow or deny connections for the SMTP servers on this system from a single address or group of addresses.
csp_IpAddressAccessListDelete	Remove an entry for the access list.

Name	Description
csp_IpAddressAccessListModify	Modify an entry in the access list that will allow or deny connections for the SMTP servers on this system from a single address or group of addresses.

Column Properties

Address

Property Name	Value
Description:	Either the IP address for a single machine, a subnet address for a group of machines, or all addresses in the IPv4 address range (signified by "*"). The address may be in the format of IPv4, IPv4 CIDR (Classless Inter-Domain Routing) , or an asterisk (*) character which means all IP addresses in the IPv4 range.
Notes:	IPv6 addresses not permitted yet.
Business Rules:	
Developer Notes:	An ip address in CIDR notation with a of /0 is not supported. To indicate ALL ip addresses in the IPv4 address range, an "*" is used.
Table/Column Mapping:	tbl_IpAddressAccessList.Address
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	^0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])((/([1-9] 1[0-9] 2[0-9] 3[0-2]))?)[*]\$
Validation - Description:	Either: * IPv4 Address= X.X.X.X where X= 0..255. (Leading zeros allowed). * IPv4 CIDR notation consisting of IPv4/N where N=1..32 * An asterisk (*) character which means allow all addressesd.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AllowConnection

Property Name	Value
Description:	A flag indicating whether the SMTP server to which this row belongs, will allow or deny connections from this IP address/group of IP addresses. Values: 0: Deny connections from this IP address/group of IP addresses 1: Allow connections from this IP address/group of IP addresses (default)
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_IpAddressAccessList.AllowConnection

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.85. vw_IpAddressAccessList_Composite

This view shows a subset of information from tbl_IpAddressAccess List, plus some derived IP address access information from tbl_LocationVPIM. This is based on the policy that all VPIM locations with specified IP addresses should automatically be granted access to the default SMTP server instance.

Additional Information

Currently the ObjectId for the SmtServerObjectId for the derived part of the query comes from the default display name of the smtp server. If this changes, then this view will not display all the correct information.

In the future, we will probably need some mechanism to decide which version of the smtp server is the "default" one or some other way to generate this view. However, for L1 this is not necessary.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Address	varchar (40 characters)	Either the IP address for a single machine, a subnet address for a group of machines, or all addresses in the IPv4 address range (signified by "*"). The address may be in the format of IPv4, IPv4 CIDR (Classless Inter-Domain Routing) , or an asterisk ("*") character which means all IP addresses in the IPv4 range.	
	AllowConnection	smallint (2 bytes)	A flag indicating whether the SMTP server to which this row belongs, will allow or deny connections from this IP address/group of IP addresses. Values: 0: Deny connections from this IP address/group of IP addresses 1: Allow connections from this IP address/group of IP addresses (default)	Bool
	SmtServerObjectId	char (36 characters)	The unique identifier of the SMTPServer to which this IP address belongs. A Foreign Key to tbl_SmtServer.ObjectId.	ObjectID

Stored Procedures

Name	Description
csp_IpAddressAccessListCreate	Create an entry in the access list that will allow or deny connections for the SMTP servers on this system from a single address or group of addresses.
csp_IpAddressAccessListDelete	Remove an entry for the access list.

Name	Description
csp_IpAddressAccessListModify	Modify an entry in the access list that will allow or deny connections for the SMTP servers on this system from a single address or group of addresses.
csp_LocationVPIMCreate	Creates a new LocationVPIM object by inserting a new row into tbl_LocationVPIM. A corresponding base Location object is also created in tbl_Location by executing csp_LocationCreate.
csp_LocationVPIMDelete	Deletes a LocationVPIM object from tbl_LocationVPIM as specified by the @ObjectId parameter.
csp_LocationVPIMModify	Updates the attributes of a LocationVPIM object and those attributes of a Location object relevant based on the values passed in via the parameters. The @ObjectId parameter identifies the LocationVPIM and Location objects that are updated.

Column Properties

Address

Property Name	Value
Description:	Either the IP address for a single machine, a subnet address for a group of machines, or all addresses in the IPv4 address range (signified by "*"). The address may be in the format of IPv4, IPv4 CIDR (Classless Inter-Domain Routing) , or an asterisk (*) character which means all IP addresses in the IPv4 range.
Notes:	IPv6 addresses not permitted yet.

Validation - Minimum Value:	
Validation - Maximum Value:	

5.86. vw_IPPortReservation

A simple view for tbl_IPPortReservation.
A range of IP ports reserved for specific purposes.

Additional Information

The following two rows are inserted by Unity setup:

- * Purpose=SIP, min/max=5060/5300, VMSServerObjectId=NULL
- * Purpose=RTPRTCP, min/max=24576/32768, VMSServerObjectId=NULL

The SIP row constrains the SIP ports that you can assign to a port group (see tbl_MediaPortGroupIPPort).

The min/max range in the RTPRTCP row is used to configure avaudio.sys, which reads its settings from the registry. Note: 24576=0x6000 and 32768=0x8000.

There can be more than one IP range per purpose/VMS combination, but the ranges cannot overlap.

Business Rules

1. The MinIPPort value must not exceed the value of MaxIPPort.
2. The following TCP/IP port resources shall be reserved on a VMS by default:
SIP/PIMG call control: 5060-5300
RTP/RTCP SCCP: 24576-32768
RTP/RTCP ASR: 32784-33084
RTP/RTCP TTS: 33184-33484
RTP/RTCP SIP/PIMG voice: 22800-24575

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxIPPort	int (4 bytes)	The upper boundary of the IP port range.	
	MinIPPort	int (4 bytes)	The lower boundary of the IP port range.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a IPPortReservation object.	ObjectID
	Purpose	smallint (2 bytes)	The purpose for which ports in this range can be used.	IPPortPurpose
	VmsServerObjectId	char (36 characters)	The unique identifier of the VMSServer object to which this range applies.	ObjectID

Stored Procedures

Name	Description
csp_IPPortReservationCreate	Creates a new IPPortReservation object by inserting a new row into tbl_IPPortReservation. A IPPortReservation object consists of a range of IP ports that are reserved for specific purposes such as reserving IP ports 5060-5300 for SIP.

Name	Description
csp_IPPortReservationDelete	Deletes a IPPortReservation object from tbl_IPPortReservation as specified by the @ObjectId parameter.
csp_IPPortReservationModify	Updates the attributes of a IPPortReservation object based on the values passed in via the parameters. The @ObjectId parameter identifies the IPPortReservation object that is updated.

Column Properties

MaxIPPort

Property Name	Value
Description:	The upper boundary of the IP port range.
Notes:	
Business Rules:	Range: 0-65535.
Developer Notes:	
Table/Column Mapping:	tbl_IPPortReservation.MaxIPPort
Primary Key:	False
Allow Null:	False
Default Value:	0

5.87. vw_LanguageMap

Simple view for tbl_LanguageMap

Maintains a mapping of language code to language abbreviation.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	LanguageAbbreviation	varchar (3 characters)	Three letter language abbreviation such as "ENU"	
PK	LanguageCode	int (4 bytes)	LanguageCode (LCID)	Language-Code
	LanguageTag	varchar (10 characters)	The locale identification expressed as a combination of the ISO language and country codes separated by a hyphen. The format used is <ll>-<CC> where <ll> is the lowercase ISO language code and <CC> is the uppercase ISO country code. e.g. fr-FR, fr-CH, fr-CA .	

Stored Procedures

vw_LanguageMap has no stored procedures.

Column Properties

LanguageAbbreviation

Property Name	Value
Description:	Three letter language abbreviation such as "ENU"
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LanguageMap.LanguageAbbreviation
Primary Key:	True
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	
SQL Data Type/Length:	varchar (3 characters)
Validation - Expression:	[A-Z]{3,3}

5.88. vw_LicenseCount

Calculates current license usage counts.

Additional Information

This is for general reference only, it is not the authoritative source of licensing information (that is the licensing component).

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	ComplianceType	int (4 bytes)	Type of license evaluation for compliance.	LicenseComplianceType
	Count	int (4 bytes)	The number of licensed items being used or NULL if not applicable	
	Limit	int (4 bytes)	The limit on the feature as set by the license files. It is a number specifying the count or the enabled/disabled state of the feature.	
PK	TagName	varchar (64 characters)	The tag or feature name.	

Stored Procedures

vw_LicenseCount has no stored procedures.

Column Properties

ComplianceType

Property Name	Value
Description:	Type of license evaluation for compliance.
Notes:	Values: 0: Not evaluated 1: Usage does not exceed the limit 2: Limit is positive and usage does not exceed it 3: Limit of 0 specifies that the usage is not allowed, other wise allowed
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.ComplianceType

5.89. vw_LicenseFileStatus

Simple view for tbl_LicenseFileStatus

Maintains the status of one or more license files for this particular system.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	FileName	varchar (64 characters)	Name of the license file (not including path).	
	Installed	smallint (2 bytes)	Indicates if license file is installed.	Bool
	Summary	varchar (254 characters)	The reason the install of the file failed (if any).	

Stored Procedures

Name	Description
csp_LicenseFileStatusCreate	Creates a new LicenseFileStatus object by inserting a new row into tbl_LicenseFileStatus.
csp_LicenseFileStatusDelete	Deletes a LicenseFileStatus object from tbl_LicenseFileStatus as specified by the @FileName parameter.
csp_LicenseFileStatusModify	Updates the attributes of a LicenseFileStatus object based on the values passed in via the parameters. The @FileName parameter identifies the LicenseFileStatus object that is updated.

Column Properties

FileName

Property Name	Value
Description:	Name of the license file (not including path).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseFileStatus.FileName

Property Name	Value
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Installed

Property Name	Value
Description:	Indicates if license file is installed.
Notes:	If license file is not installed there may have been a failure. Details of failure are stored in the Summary column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseFileStatus.Installed
Primary Key:	False
Allow Null:	False
Default Value:	0

Validation - Minimum Length:	1 characters
Validation - Maximum Length:	254 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.90. vw_LicenseStatus

Simple view for tbl_LicenseStatus

Maintains the overall status of the license features, which are an amalgamation of entries from one or more license files.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	ComplianceTime	datetime (8 bytes)	The last time when this feature was compliant.	
	ComplianceType	int (4 bytes)	Type of license evaluation for compliance.	LicenseComplianceType
	LastRestartTime	datetime (8 bytes)	The time when the process related to the feature was last restarted.	
	Limit	int (4 bytes)	The limit on the feature as set by the license files. It is a number specifying the count or the enabled/disabled state of the feature.	
	NextExpiryTime	datetime (8 bytes)	The next expiry time for this feature as per the license tags for this feature.	
	Overdraft	int (4 bytes)	Overdraft.	
	RestartLimit	int (4 bytes)	The limit which will be effective after the process related to the feature is restarted.	
	Status	int (4 bytes)	The status value of this license feature.	LicenseStatus
PK	TagName	varchar (64 characters)	The tag or feature name.	
	Usage	int (4 bytes)	The current usage of the feature in the system. It is a number specifying the current usage count or if the feature is in use.	

Stored Procedures

Name	Description
csp_LicenseStatusCreate	Creates a new LicenseStatus object by inserting a new row into tbl_LicenseStatus.
csp_LicenseStatusDelete	Deletes a LicenseStatus object from tbl_LicenseStatus as specified by the @TagName parameter.
csp_LicenseStatusModify	Updates the attributes of a LicenseStatus object based on the values passed in via the parameters. The @TagName parameter identifies the LicenseStatus object that is updated.

Column Properties

ComplianceTime

Property Name	Value
Description:	The last time when this feature was compliant.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.ComplianceTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:

SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Limit

Property Name	Value
Description:	The limit on the feature as set by the license files. It is a number specifying the count or the enabled/disabled state of the feature.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.Limit
Primary Key:	False
Allow Null:	False
Default Value:	0

Property Name	Value
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NextExpiryTime

Property Name	Value
Description:	The next expiry time for this feature as per the license tags for this feature.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.NextExpiryTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Overdraft

Property Name	Value
Description:	Overdraft.
Notes:	Not currently used - for future use.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.Overdraft

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RestartLimit

Property Name	Value
Description:	The limit which will be effective after the process related to the feature is restarted.
Notes:	For example, the VoicePortMax limit will be effective only after restarting the CuCsMgr
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.RestartLimit
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Status

Property Name	Value
Description:	The status value of this license feature.

Property Name	Value
Notes:	Values: 0: Unknown - not evaluated 1: Evaluated and is valid 2: Violated - system will shutdown after grace period expires since ComplianceTime 3: Grace period has expired and system will be shutdown
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.Status
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	LicenseStatus
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TagName

Property Name	Value
Description:	The tag or feature name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.TagName
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Usage

Property Name	Value
Description:	The current usage of the feature in the system. It is a number specifying the current usage count or 1 if the feature is in use.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LicenseStatus.Usage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.91. vw_LocalizedText

A simple view for tbl_LocalizedText.

Text localized for specific immutable strings used in the administration interface.

Additional Information

Besides storing the localized text for immutable strings such as the localized names of user privileges or localized names of VMS server templates and roles, this table is also used to store the localized strings for items in the administrative interface that are added dynamically to a system. Currently there are only two things in the administrative interface that require this capability:

- * Subscriber conversation names, e.g. "Standard Conversation," "Optional Conversation 1"
- * Routable conversation names, e.g. user input keys, after message actions, after greeting actions, exit actions, etc.

This table is normally populated during system install.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	LanguageCode	int (4 bytes)	The language code (LCID) indicating the language of the text in the LocalizedName column.	Language-Code
PK	LocalizationKey	varchar (192 characters)	A familiar name referenced by other tables to obtain the localized name.	
	LocalizedName	lvarchar (1024 characters)	The localized version of the string.	

Stored Procedures

vw_LocalizedText has no stored procedures.

Column Properties

LanguageCode

Property Name	Value
Description:	The language code (LCID) indicating the language of the text in the LocalizedName column.

Property Name	Value
Notes:	<p>The Windows Locale ID (LCID) which is a 32-bit value defined by Windows that consists of a language ID, a sort ID, and reserved bits. For example, the LCID for US English is 1033.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241</p> <p>10249: English_Belize 10249</p> <p>1025: Arabic_Saudi_Arabia 1025</p> <p>10250: Spanish_Peru 10250</p> <p>1026: Bulgarian 1026</p> <p>1027: Catalan 1027</p> <p>1028: Chinese_Taiwan 1028</p> <p>1029: Czech 1029</p> <p>1030: Danish 1030</p> <p>1031: German_Standard 1031</p> <p>1032: Greek 1032</p> <p>1033: English_United_States 1033</p> <p>1034: Spanish_Traditional_Sort 1034</p> <p>1035: Finnish 1035</p> <p>1036: French_Standard 1036</p> <p>1037: Hebrew 1037</p> <p>1038: Hungarian 1038</p> <p>1039: Icelandic 1039</p> <p>1040: Italian_Standard 1040</p> <p>1041: Japanese 1041</p> <p>1042: Korean 1042</p> <p>1043: Dutch_Standard 1043</p> <p>1044: Norwegian_Bokmal 1044</p> <p>1045: Polish 1045</p> <p>1046: Portuguese_Brazilian 1046</p> <p>1047: Rhaeto-Romanic 1047</p> <p>1048: Romanian 1048</p> <p>1049: Russian 1049</p> <p>1050: Croatian 1050</p> <p>1051: Slovak 1051</p> <p>1052: Albanian 1052</p> <p>1053: Swedish 1053</p> <p>1054: Thai 1054</p> <p>1055: Turkish 1055</p> <p>1056: Urdu 1056</p> <p>1057: Indonesian 1057</p> <p>1058: Ukrainian 1058</p> <p>1059: Belarusian 1059</p> <p>1060: Slovenian 1060</p> <p>1061: Estonian 1061</p> <p>1062: Latvian 1062</p> <p>1063: Lithuanian 1063</p> <p>1065: Farsi 1065</p> <p>1066: Vietnamese 1066</p> <p>1067: Armenian 1067</p> <p>1068: Azeri_Latin 1068</p> <p>1069: Basque 1069</p> <p>1070: Sorbian 1070</p> <p>1071: Macedonian 1071</p> <p>1072: Sutu 1072</p> <p>1073: Tsonga 1073</p>

5.92. vw_LocalVms

A recordset containing the properties of the local location VMS.

Additional Information

In K1, there is **only** the local VMS.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AddressingMaxScope	smallint (2 bytes)	<p>The scope (e.g., local VMS, dialing domain, entire Unity organization) of the search that Cisco Unity Connection performs when searching for a matching extension in the following cases:</p> <ul style="list-style-type: none"> * When a subscriber addresses a message by using the phone. * When subscribers add members to private lists by using the phone or the Cisco Unity Connection Assistant. * When an administrator adds members to system or personal distribution lists by using the Cisco Unity Connection Administration. * When Cisco Unity Connection looks up the recipient for an incoming AMIS message. 	Addressing-MaxScope
	AgcTargetDb	smallint (2 bytes)	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.	
	AllowBlindAddressing	smallint (2 bytes)	A flag indicating whether messages can be addressed to this location without an existing handler or subscriber.	Bool
	BlindAddressingMax-Scope	smallint (2 bytes)	The scope (e.g., none, local VMS server, dialing domain, entire Unity organization) of the blind addressing search for a matching delivery location that Cisco Unity Connection performs when a subscriber addresses a message by using the phone.	BlindAddressingMaxScope
	DefaultLanguage	int (4 bytes)	Default language for subscribers and call handlers.	Language-Code
	DefaultTTSLanguage	int (4 bytes)	Default language to use for TTS playback.	Language-Code

Key	Name	SQL Data Type/Length	Description	Custom Type
	DefaultWaveFormatObjectId	char (36 characters)	The unique identifier of the WaveFormat object that specifies the wave format in which recorded messages are stored if the requested format is not available on the system.	ObjectID
	DestinationType	int (4 bytes)	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.	Destination-Type
	DialingDomainName	nvarchar (40 characters)	The name of the dialing domain of which this location is a member.	
	DisplayName	nvarchar (64 characters)	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id for the location.	DtmfAccessId
	DtmfName	varchar (16 characters)	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.	DtmfName
	IncludeLocations	smallint (2 bytes)	A flag indicating whether locations are included in searches. If set on the LocationVMS, the conversation will include locations in the search results.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this location object is the "primary" location, which cannot be deleted. (Used to prevent deletion of factory defaults.)	Bool
	KeypadMapId	smallint (2 bytes)	The keypad map used by this location. The keypad map specifies the numeric keys to which the letters Q and Z are assigned to on the phone. This is specified during Cisco Unity Connection setup.	KeypadMap
	LastLicenseEvalTime	datetime (8 bytes)	The last time the license evaluation was done.	
	LocalPhonePrefix	nvarchar (64 characters)	<p>The number that is used to construct addresses for Cisco Unity Connection subscribers who send messages to individuals who use the voice messaging system that corresponds to this delivery location.</p> <p>On outgoing messages from Cisco Unity Connection subscribes to subscribers at this VPIM location, the prefix is added to the beginning of the sender mailbox number to form the From address.</p> <p>On incoming messages to Cisco Unity Connection subscribers from subscribers at this VPIM location, the prefix is removed from the beginning of the recipient mailbox number to form the To address.</p>	
	MaxContacts	int (4 bytes)	The maximum number of contacts that can be created for this location.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxGreetingLength	int (4 bytes)	The maximum length (in seconds) allowed for recording a system greeting.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a LocationVMS object.	ObjectID
	OverallLicenseState	int (4 bytes)	Specifies the overall license state. It is valid if none of the license feature is in shutdown state. When this state becomes shutdown, the application will be shutdown.	LicenseStatus
	SkinnyLocalCACertificate	lvvarchar (8000 characters)	The X.509 certificate formatted as a PEM format string (base-64 encoded).	
	SkinnyLocalCACertificateFileName	nvarchar (40 characters)	The file name that should be assigned to the SkinnyLocalCACertificate to install the certificate on the Cisco Unified Communications Manager server(s). Installing the certificate on the CCM servers causes CCM to trust any Skinny device certificates signed by it, which is what we need to establish TLS Skinny connections to the CCM servers in the cluster.	
	SkinnyLocal-CAPrivateKey	lvvarchar (8000 characters)	The RSA private key matching the public key in SkinnyDeviceCertificate in PEM format (base-64 encoded string).	
	SmtpDomain	varchar (255 characters)	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtAddress).	DomainName
	SmtpSmartHost	varchar (40 characters)	IP address or host name of SMTP smart host.	
	TimeZone	int (4 bytes)	The TimeZone associated with this VMS.	
	TransferDialString	nvarchar (128 characters)	The phone number that a local Cisco Unity Connection VMS server dials to transfer a call to this Cisco Unity Connection VMS server.	
	TransferNumberOfRings	int (4 bytes)	The number of rings the local Cisco Unity Connection VMS server waits for this Cisco Unity Connection VMS server to answer. If this Cisco Unity Connection VMS server does not answer after the specified number of rings, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	TransferTimeout	int (4 bytes)	The amount of time (in milliseconds) the local Cisco Unity Connection VMS server will wait for a response from this Cisco Unity Connection VMS server after this Cisco Unity Connection VMS server has answered the call. If this VMS server does not respond within the specified time period, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.	
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded voice name for the location,	FileNameGuid

Stored Procedures

vw_LocalVms has no stored procedures.

Column Properties

AddressingMaxScope

Property Name	Value
Description:	<p>The scope (e.g., local VMS, dialing domain, entire Unity organization) of the search that Cisco Unity Connection performs when searching for a matching extension in the following cases:</p> <ul style="list-style-type: none"> * When a subscriber addresses a message by using the phone. * When subscribers add members to private lists by using the phone or the Cisco Unity Connection Assistant. * When an administrator adds members to system or personal distribution lists by using the Cisco Unity Connection Administration. * When Cisco Unity Connection looks up the recipient for an incoming AMIS message.
Notes:	<p>Values:</p> <p>0: Local VMS - limits the search to subscribers created on the local Cisco Unity Connection VMS server.</p> <p>1: Dialing Domain.- if a match is not found while searching the local Cisco Unity Connection VMS server, the search expands to include subscribers created on other Cisco Unity Connection servers that are in the same dialing domain as the local Cisco Unity Connection VMS server.</p> <p>2: Unity organization - after searching the local Cisco Unity Connection VMS server and then the dialing domain (if there is one), the search expands to include every subscriber created on other Cisco Unity Connection VMS servers in the entire Unity organization.</p>
Business Rules:	
Developer Notes:	Moved from tbl_Location

Property Name	Value
Table/Column Mapping:	tbl_LocationVMS.AddressingMaxScope
Primary Key:	False
Allow Null:	False
Default Value:	0

SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AgcTargetDb

Property Name	Value
Description:	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.
Notes:	<p>AGC will attempt to modify the incoming recording to match AGCTargetDB. This value is in decibels (dB) relative to the maximum amplitude possible for a PCM-encoded waveform, thus it is always less than zero. Values closer to zero are higher volume. Thus -10 dB is louder than -15 dB.</p> <p>AGC only affects recordings made with Cisco Unity Connection. AGC does not directly affect playback.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.AgcTargetDb
Primary Key:	False
Allow Null:	False
Default Value:	-26
Custom Type:

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	-35
Validation - Maximum Value:	-15

AllowBlindAddressing

Property Name	Value
Description:	A flag indicating whether messages can be addressed to this location without an existing handler or subscriber.
Notes:	Values: 0: Blind address searches are not allowed 1: Blind address searches are allowed
Business Rules:	
Developer Notes:	Moved from tbl_Location. For conversations, AMIS systems will look like locations that allow blind addressing.
Table/Column Mapping:	tbl_LocationVMS.AllowBlindAddressing
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

BlindAddressingMaxScope

Property Name	Value
Description:	The scope (e.g., none, local VMS server, dialing domain, entire Unity organization) of the blind addressing search for a matching delivery location that Cisco Unity Connection performs when a subscriber addresses a message by using the phone.
Notes:	Blind addressing provides a powerful tool for large sites who would like to share voice messaging capabilities across remote locations but do not want to synchronize messages and directory information across those same sites. Values: 0: None - blind address searches are not allowed. 1: Local VMS - limits the search to delivery locations that were created on the local Cisco Unity Connection VMS server. 2: Dialing domain - if a match is not found while searching the local Cisco Unity Connection VMS server, the blind addressing search expands to include those delivery locations created on other Cisco Unity Connection VMS servers that are in the same dialing domain as the local Cisco Unity Connection VMS server. 3: Organization - after searching the local Cisco Unity Connection VMS server and then the dialing domain (if there is one), the search expands to include every delivery location created on other Cisco Unity Connection VMS servers in the entire Unity organization.

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialingDomainName

Property Name	Value
Description:	The name of the dialing domain of which this location is a member.
Notes:	<p>A dialing domain is a collection of Unity VMS servers for which access codes or any other type of prefixing is not required to dial between the subscribers that are homed on each VMS server. A dialing domain provides a means to set the search scope for message addressing and for call transfers from the auto attendant and directory handler(s).</p> <p>Note that the dialing domain name is case sensitive and must be entered the same on all Cisco Unity Connection VMS servers that are members of the dialing domain.</p> <p>There is no limit to the number of Cisco Unity Connection VMS servers that can be assigned to a single dialing domain, and there is no limit to the number of dialing domains. However, a Cisco Unity Connection VMS server can be a member of only one dialing domain.</p>
Business Rules:	A Cisco Unity Connection VMS server can be a member of only one dialing domain.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DialingDomainName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	The name of a location must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id for the location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.@,,:;+ \% ' \()\~\]*\$

Property Name	Value
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.
Notes:	
Business Rules:	When the display name of a location is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DtmfName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeLocations

Property Name	Value
Description:	A flag indicating whether locations are included in searches. If set on the LocationVMS, the conversation will include locations in the search results.

Property Name	Value
Notes:	<p>Values:</p> <p>0: Do not include locations in search results</p> <p>1: Include locations in search results</p> <p>For this setting to be useful to subscribers, locations need to have recorded voice names. When enabled, this setting allows subscribers to address a message in two steps. First subscribers select a particular location (either by spelling the name or by entering the Dial ID). If Cisco Unity Connection finds a matching location, the recorded voice name for the location is played (assuming one has been recorded), and subscribers are prompted to either spell the name or enter the extension of the recipient. This allows subscribers to limit a search for a recipient to a specific location.</p> <p>This option is useful when the global directory is large and addressing a message by name results in many matches.</p>
Business Rules:	
Developer Notes:	Moved from tbl_Location
Table/Column Mapping:	tbl_LocationVMS.IncludeLocations
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this location object is the "primary" location, which cannot be deleted. (Used to prevent deletion of factory defaults.)
Notes:	<p>Each Cisco Unity Connection VMS server has a primary location, which is created during installation and which cannot be deleted. The primary location identifies the Cisco Unity Connection VMS server and contains the networking information needed to communicate with other locations, which can be Cisco Unity Connection servers or other voice messaging systems. The only location that cannot be deleted is the default "primary" location created by setup.</p> <p>Values:</p> <p>0: Not primary location</p> <p>1: Primary location</p>
Business Rules:	If True, this location object cannot be deleted.

Property Name	Value
Developer Notes:	This is one easy way to find the primary location object when you need it.
Table/Column Mapping:	tbl_LocationVMS.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

KeypadMapId

Property Name	Value
Description:	The keypad map used by this location. The keypad map specifies the numeric keys to which the letters Q and Z are assigned to on the phone. This is specified during Cisco Unity Connection setup.
Notes:	Values: 1: Map 1 - letter Q is mapped to the 7 key, Z to the 9 key. 2: Map 2 - letters Q and Z are mapped to the 1 key. 3: Map 3 - letters Q and Z are mapped to the 0 key.
Business Rules:	
Developer Notes:	Moved from tbl_Location
Table/Column Mapping:	tbl_LocationVMS.KeypadMapId
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	KeypadMap
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastLicenseEvalTime

Property Name	Value
Description:	The last time the license evaluation was done.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.LastLicenseEvalTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocalPhonePrefix

Property Name	Value
Description:	<p>The number that is used to construct addresses for Cisco Unity Connection subscribers who send messages to individuals who use the voice messaging system that corresponds to this delivery location.</p> <p>On outgoing messages from Cisco Unity Connection subscribes to subscribers at this VPIM location, the prefix is added to the beginning of the sender mailbox number to form the From address.</p> <p>On incoming messages to Cisco Unity Connection subscribers from subscribers at this VPIM location, the prefix is removed from the beginning of the recipient mailbox number to form the To address.</p>
Notes:	<p>For example, if a subscriber extension is 1234 and their full phone number is 2065551234, the LocalPhonePrefix would be 206555.</p> <p>This is used currently for addressing via VPIM to other systems, but may see other use moving forward.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.LocalPhonePrefix
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Digits 0-9 only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxContacts

Property Name	Value
Description:	The maximum number of contacts that can be created for this location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.MaxContacts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxGreetingLength

Property Name	Value
Description:	The maximum length (in seconds) allowed for recording a system greeting.
Notes:	
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_LocationVMS.MaxGreetingLength
Primary Key:	False
Allow Null:	False
Default Value:	90
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a LocationVMS object.
Notes:	The value of this objectid is the same as the tbl_Location.ObjectId.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OverallLicenseState

Property Name	Value
Description:	Specifies the overall license state. It is valid if none of the license feature is in shutdown state. When this state becomes shutdown, the application will be shutdown.
Notes:	Values: 0: Unknown - not evaluated 1: Evaluated and is valid 2: Violated - system will shutdown after grace period expires since ComplianceTime 3: Grace period has expired and system will be shutdown
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.OverallLicenseState
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	LicenseStatus
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyLocalCACertificate

Property Name	Value
Description:	The X.509 certificate formatted as a PEM format string (base-64 encoded).
Notes:	
Business Rules:	Pertinent only if telephony integration method is Skinny.
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCACertificate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (8000 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	8000 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

SkinnyLocalCACertificateFileName

Property Name	Value
Description:	The file name that should be assigned to the SkinnyLocalCACertificate to install the certificate on the Cisco Unified Communications Manager server(s). Installing the certificate on the CCM servers causes CCM to trust any Skinny device certificates signed by it, which is what we need to establish TLS Skinny connections to the CCM servers in the cluster.
Notes:	
Business Rules:	
Developer Notes:	The file name is calculated by same component that generates the value of SkinnyLocalCACertificate. The file name is the hash of the certificate subject with ".0" appended.
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCACertificateFileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyLocalCAPrivateKey

Property Name	Value
Description:	The RSA private key matching the public key in SkinnyDeviceCertificate in PEM format (base-64 encoded string).
Notes:	
Business Rules:	Pertinent only if telephony integration method is Skinny.
Developer Notes:	The key is encrypted using a symmetric algorithm known to the key generation facility and the Skinny TSP.
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCAPrivateKey
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (8000 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	8000 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtplibDomain

Property Name	Value
Description:	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtplibAddress).
Notes:	<p>The domain name is required by UMSS, and for the VPIM networking options. Both of these networking options use the Simple Mail Transfer Protocol (SMTP) for messaging between the local Cisco Unity Connection VMS server and the remote voice messaging system. When a subscriber on the local Cisco Unity Connection VMS server addresses a message to a remote user, Cisco Unity Connection uses the SMTP Domain Name to construct a From address, which is required by SMTP. Messages that are missing the domain name in the From address will not be delivered. Additionally, a valid From address allows the remote recipient to reply to the message.</p> <p>The syntax specification for this column is based on RFC 1035 (Domain Names - Implementation and Specification) and RFC 2282 (Internet Message Format). The syntax allows "host name" and FQDN as valid domain name.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.SmtplibDomain
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DomainName
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^([a-zA-Z]([a-zA-Z\d]*[a-zA-Z\d])?.)+([a-zA-Z\d])+\$.

Property Name	Value
Validation - Description:	<code><domain> ::= <subdomain> " "</code> <code><subdomain> ::= <label> <subdomain> "." <label></code> <code><label> ::= <letter> [[<ldh-str>] <let-dig>]</code> <code><ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str></code> <code><let-dig-hyp> ::= <let-dig> "-"</code> The labels must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	255 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtSmartHost

Property Name	Value
Description:	IP address or host name of SMTP smart host.
Notes:	IPv6 addresses not supported.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.SmtSmartHost
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	The TimeZone associated with this VMS.
Notes:	Refers to entry in tbl_TimeZone table.
Business Rules:	

Property Name	Value
Developer Notes:	Default to 4 (PST) to ensure it is non-NULL. We set it from the OS during setup.
Table/Column Mapping:	tbl_LocationVMS.TimeZone
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferDialString

Property Name	Value
Description:	The phone number that a local Cisco Unity Connection VMS server dials to transfer a call to this Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferDialString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferNumberOfRings

Property Name	Value
Description:	The number of rings the local Cisco Unity Connection VMS server waits for this Cisco Unity Connection VMS server to answer. If this Cisco Unity Connection VMS server does not answer after the specified number of rings, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferNumberOfRings
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferTimeout

Property Name	Value
Description:	The amount of time (in milliseconds) the local Cisco Unity Connection VMS server will wait for a response from this Cisco Unity Connection VMS server after this Cisco Unity Connection VMS server has answered the call. If this VMS server does not respond within the specified time period, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferTimeout
Primary Key:	False
Allow Null:	False
Default Value:	5000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded voice name for the location,
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AllowBlindAddressing	smallint (2 bytes)	A flag indicating whether messages can be addressed to this location without an existing handler or subscriber.	Bool
	DestinationType	int (4 bytes)	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.	Destination-Type
	DialingDomainName	nvarchar (40 characters)	The name of the dialing domain of which this location is a member.	
	DisplayName	nvarchar (64 characters)	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	DtmfName	varchar (16 characters)	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.	DtmfName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Location object.	ObjectID
	SmtpDomain	varchar (255 characters)	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtpAddress).	DomainName
	VoiceName	varchar (40 characters)	Name of stream file with voice name for this location.	FileNameGuid

Stored Procedures

Name	Description
csp_LocationDelete	Deletes a Location object from tbl_Location as specified by the @ObjectId parameter.

Name	Description
csp_LocationVMSCreate	Creates a new LocationVMS object by inserting a new row into tbl_LocationVMS. A corresponding base Location object is also created in tbl_Location by executing csp_LocationCreate.
csp_LocationVMSDelete	Deletes a LocationVMS object from tbl_LocationVMS as specified by the @ObjectId parameter.
csp_LocationVMSModify	Updates the attributes of a LocationVMS object and those attributes of a Location object relevant to a VMS based on the values passed in via the parameters. The @ObjectId parameter identifies the LocationVMS and Location objects that are updated.
csp_LocationVPIMCreate	Creates a new LocationVPIM object by inserting a new row into tbl_LocationVPIM. A corresponding base Location object is also created in tbl_Location by executing csp_LocationCreate.
csp_LocationVPIMDelete	Deletes a LocationVPIM object from tbl_LocationVPIM as specified by the @ObjectId parameter.
csp_LocationVPIMModify	Updates the attributes of a LocationVPIM object and those attributes of a Location object relevant based on the values passed in via the parameters. The @ObjectId parameter identifies the LocationVPIM and Location objects that are updated.

Column Properties

AllowBlindAddressing

Property Name	Value
Description:	A flag indicating whether messages can be addressed to this location without an existing handler or subscriber.
Notes:	Values: 0: Blind address searches are not allowed 1: Blind address searches are allowed
Business Rules:	
Developer Notes:	Moved from tbl_Location. For conversations, AMIS systems will look like locations that allow blind addressing.
Table/Column Mapping:	tbl_LocationVMS.AllowBlindAddressing
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DestinationType

Property Name	Value
Description:	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.
Notes:	Values: 1: Cisco Unity Connection location. 2: SMTP location. 5: AMIS location. 7: Cisco Unity Connection Bridge. 8: VPIM location.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.DestinationType
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	DestinationType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialingDomainName

Property Name	Value
Description:	The name of the dialing domain of which this location is a member.

Property Name	Value
Notes:	<p>A dialing domain is a collection of Unity VMS servers for which access codes or any other type of prefixing is not required to dial between the subscribers that are homed on each VMS server. A dialing domain provides a means to set the search scope for message addressing and for call transfers from the auto attendant and directory handler(s).</p> <p>Note that the dialing domain name is case sensitive and must be entered the same on all Cisco Unity Connection VMS servers that are members of the dialing domain.</p> <p>There is no limit to the number of Cisco Unity Connection VMS servers that can be assigned to a single dialing domain, and there is no limit to the number of dialing domains. However, a Cisco Unity Connection VMS server can be a member of only one dialing domain.</p>
Business Rules:	A Cisco Unity Connection VMS server can be a member of only one dialing domain.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DialingDomainName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	The name of a location must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.

Property Name	Value
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ %\?\'()\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.
Notes:	
Business Rules:	When the display name of a location is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DtmfName
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Location object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Location.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtDomain

Property Name	Value
Description:	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtAddress).

Property Name	Value
Notes:	<p>The domain name is required by UMSS, and for the VPIM networking options. Both of these networking options use the Simple Mail Transfer Protocol (SMTP) for messaging between the local Cisco Unity Connection VMS server and the remote voice messaging system. When a subscriber on the local Cisco Unity Connection VMS server addresses a message to a remote user, Cisco Unity Connection uses the SMTP Domain Name to construct a From address, which is required by SMTP. Messages that are missing the domain name in the From address will not be delivered. Additionally, a valid From address allows the remote recipient to reply to the message.</p> <p>The syntax specification for this column is based on RFC 1035 (Domain Names - Implementation and Specification) and RFC 2282 (Internet Message Format). The syntax allows "host name" and FQDN as valid domain name.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.SmtDomain
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DomainName
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^([a-zA-Z](\-[a-zA-Z\d]*[a-zA-Z\d])?.)+([a-zA-Z\d])+ \$
Validation - Description:	<p><domain> ::= <subdomain> " "</p> <p><subdomain> ::= <label> <subdomain> "." <label></p> <p><label> ::= <letter> [[<ldh-str>] <let-dig>]</p> <p><ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str></p> <p><let-dig-hyp> ::= <let-dig> "-"</p> <p>The labels must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.</p>
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	255 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	Name of stream file with voice name for this location.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AddressingMaxScope	smallint (2 bytes)	<p>The scope (e.g., local VMS, dialing domain, entire Unity organization) of the search that Cisco Unity Connection performs when searching for a matching extension in the following cases:</p> <ul style="list-style-type: none"> * When a subscriber addresses a message by using the phone. * When subscribers add members to private lists by using the phone or the Cisco Unity Connection Assistant. * When an administrator adds members to system or personal distribution lists by using the Cisco Unity Connection Administration. * When Cisco Unity Connection looks up the recipient for an incoming AMIS message. 	AddressingMaxScope
	AgcTargetDb	smallint (2 bytes)	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.	
	AllowBlindAddressing	smallint (2 bytes)	A flag indicating whether messages can be addressed to this location without an existing handler or subscriber.	Bool
	BlindAddressingMaxScope	smallint (2 bytes)	The scope (e.g., none, local VMS server, dialing domain, entire Unity organization) of the blind addressing search for a matching delivery location that Cisco Unity Connection performs when a subscriber addresses a message by using the phone.	BlindAddressingMaxScope
	DefaultLanguage	int (4 bytes)	Default language for subscribers and call handlers.	Language-Code
	DefaultTTSLanguage	int (4 bytes)	Default language to use for TTS playback.	Language-Code

Key	Name	SQL Data Type/Length	Description	Custom Type
	DefaultWaveFormatObjectId	char (36 characters)	The unique identifier of the WaveFormat object that specifies the wave format in which recorded messages are stored if the requested format is not available on the system.	ObjectID
	DestinationType	int (4 bytes)	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.	Destination-Type
	DialingDomainName	nvarchar (40 characters)	The name of the dialing domain of which this location is a member.	
	DisplayName	nvarchar (64 characters)	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id for the VMS.	DtmfAccessId
	DtmfName	varchar (16 characters)	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.	DtmfName
	IncludeLocations	smallint (2 bytes)	A flag indicating whether locations are included in searches. If set on the LocationVMS, the conversation will include locations in the search results.	Bool
	IsPrimary	smallint (2 bytes)	A flag indicating whether this location object is the "primary" location, which cannot be deleted. (Used to prevent deletion of factory defaults.)	Bool
	KeypadMapId	smallint (2 bytes)	The keypad map used by this location. The keypad map specifies the numeric keys to which the letters Q and Z are assigned to on the phone. This is specified during Cisco Unity Connection setup.	KeypadMap
	LastLicenseEvalTime	datetime (8 bytes)	The last time the license evaluation was done.	
	LocalPhonePrefix	nvarchar (64 characters)	<p>The number that is used to construct addresses for Cisco Unity Connection subscribers who send messages to individuals who use the voice messaging system that corresponds to this delivery location.</p> <p>On outgoing messages from Cisco Unity Connection subscribes to subscribers at this VPIM location, the prefix is added to the beginning of the sender mailbox number to form the From address.</p> <p>On incoming messages to Cisco Unity Connection subscribers from subscribers at this VPIM location, the prefix is removed from the beginning of the recipient mailbox number to form the To address.</p>	
	MaxContacts	int (4 bytes)	The maximum number of contacts that can be created for this location.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxGreetingLength	int (4 bytes)	The maximum length (in seconds) allowed for recording a system greeting.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a LocationVMS object.	ObjectID
	OverallLicenseState	int (4 bytes)	Specifies the overall license state. It is valid if none of the license feature is in shutdown state. When this state becomes shutdown, the application will be shutdown.	LicenseStatus
	SkinnyLocalCACertificate	lvvarchar (8000 characters)	The X.509 certificate formatted as a PEM format string (base-64 encoded).	
	SkinnyLocalCACertificateFileName	nvvarchar (40 characters)	The file name that should be assigned to the SkinnyLocalCACertificate to install the certificate on the Cisco Unified Communications Manager server(s). Installing the certificate on the CCM servers causes CCM to trust any Skinny device certificates signed by it, which is what we need to establish TLS Skinny connections to the CCM servers in the cluster.	
	SkinnyLocalCAPrivateKey	lvvarchar (8000 characters)	The RSA private key matching the public key in SkinnyDeviceCertificate in PEM format (base-64 encoded string).	
	SmtDomain	vvarchar (255 characters)	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtAddress).	DomainName
	SmtSmartHost	vvarchar (40 characters)	IP address or host name of SMTP smart host.	
	TimeZone	int (4 bytes)	The TimeZone associated with this VMS.	
	TransferDialString	nvvarchar (128 characters)	The phone number that a local Cisco Unity Connection VMS server dials to transfer a call to this Cisco Unity Connection VMS server.	
	TransferNumberOfRings	int (4 bytes)	The number of rings the local Cisco Unity Connection VMS server waits for this Cisco Unity Connection VMS server to answer. If this Cisco Unity Connection VMS server does not answer after the specified number of rings, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	TransferTimeout	int (4 bytes)	The amount of time (in milliseconds) the local Cisco Unity Connection VMS server will wait for a response from this Cisco Unity Connection VMS server after this Cisco Unity Connection VMS server has answered the call. If this VMS server does not respond within the specified time period, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.	
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded voice name for the location	FileNameGuid

Stored Procedures

Name	Description
csp_LocationVMSCreate	Creates a new LocationVMS object by inserting a new row into tbl_LocationVMS. A corresponding base Location object is also created in tbl_Location by executing csp_LocationCreate.
csp_LocationVMSDelete	Deletes a LocationVMS object from tbl_LocationVMS as specified by the @ObjectId parameter.
csp_LocationVMSModify	Updates the attributes of a LocationVMS object and those attributes of a Location object relevant to a VMS based on the values passed in via the parameters. The @ObjectId parameter identifies the LocationVMS and Location objects that are updated.

Column Properties

AddressingMaxScope

Property Name	Value
Description:	<p>The scope (e.g., local VMS, dialing domain, entire Unity organization) of the search that Cisco Unity Connection performs when searching for a matching extension in the following cases:</p> <ul style="list-style-type: none"> * When a subscriber addresses a message by using the phone. * When subscribers add members to private lists by using the phone or the Cisco Unity Connection Assistant. * When an administrator adds members to system or personal distribution lists by using the Cisco Unity Connection Administration. * When Cisco Unity Connection looks up the recipient for an incoming AMIS message.

Property Name	Value
Notes:	<p>Values:</p> <p>0: Local VMS - limits the search to subscribers created on the local Cisco Unity Connection VMS server.</p> <p>1: Dialing Domain.- if a match is not found while searching the local Cisco Unity Connection VMS server, the search expands to include subscribers created on other Cisco Unity Connection servers that are in the same dialing domain as the local Cisco Unity Connection VMS server.</p> <p>2: Unity organization - after searching the local Cisco Unity Connection VMS server and then the dialing domain (if there is one), the search expands to include every subscriber created on other Cisco Unity Connection VMS servers in the entire Unity organization.</p>
Business Rules:

Validation - Maximum Value:	

AgcTargetDb

Property Name	Value
Description:	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.
Notes:	<p>AGC will attempt to modify the incoming recording to match AGCTargetDB. This value is in decibels (dB) relative to the maximum amplitude possible for a PCM-encoded waveform, thus it is always less than zero. Values closer to zero are higher volume. Thus -10 dB is louder than -15 dB.</p> <p>AGC only affects recordings made with Cisco Unity Connection. AGC does not directly affect playback.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.AgcTargetDb
Primary Key:	False

Property Name	Value

DialingDomainName

Property Name	Value
Description:	The name of the dialing domain of which this location is a member.
Notes:	<p>A dialing domain is a collection of Unity VMS servers for which access codes or any other type of prefixing is not required to dial between the subscribers that are homed on each VMS server. A dialing domain provides a means to set the search scope for message addressing and for call transfers from the auto attendant and directory handler(s).</p> <p>Note that the dialing domain name is case sensitive and must be entered the same on all Cisco Unity Connection VMS servers that are members of the dialing domain.</p> <p>There is no limit to the number of Cisco Unity Connection VMS servers that can be assigned to a single dialing domain, and there is no limit to the number of dialing domains. However, a Cisco Unity Connection VMS server can be a member of only one dialing domain.</p>
Business Rules:	A Cisco Unity Connection VMS server can be a member of only one dialing domain.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DialingDomainName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	The name of a location must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id for the VMS.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.@,;\+ \% ' \()\~\]*\$

Property Name	Value
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The series of digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the display name of the location. These digits are used for searching the location by name via the phone.
Notes:	
Business Rules:	When the display name of a location is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DtmfName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeLocations

Property Name	Value
Description:	A flag indicating whether locations are included in searches. If set on the LocationVMS, the conversation will include locations in the search results.

Property Name	Value
Notes:	<p>Values:</p> <p>0: Do not include locations in search results</p> <p>1: Include locations in search results</p> <p>For this setting to be useful to subscribers, locations need to have recorded voice names. When enabled, this setting allows subscribers to address a message in two steps. First subscribers select a particular location (either by spelling the name or by entering the Dial ID). If Cisco Unity Connection finds a matching location, the recorded voice name for the location is played (assuming one has been recorded), and subscribers are prompted to either spell the name or enter the extension of the recipient. This allows subscribers to limit a search for a recipient to a specific location.</p> <p>This option is useful when the global directory is large and addressing a message by name results in many matches.</p>
Business Rules:	
Developer Notes:	Moved from tbl_Location
Table/Column Mapping:	tbl_LocationVMS.IncludeLocations
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this location object is the "primary" location, which cannot be deleted. (Used to prevent deletion of factory defaults.)
Notes:	<p>Each Cisco Unity Connection VMS server has a primary location, which is created during installation and which cannot be deleted. The primary location identifies the Cisco Unity Connection VMS server and contains the networking information needed to communicate with other locations, which can be Cisco Unity Connection servers or other voice messaging systems. The only location that cannot be deleted is the default "primary" location created by setup.</p> <p>Values:</p> <p>0: Not primary location</p> <p>1: Primary location</p>
Business Rules:	If True, this location object cannot be deleted.

Property Name	Value
Developer Notes:	This is one easy way to find the primary location object when you need it.
Table/Column Mapping:	tbl_LocationVMS.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

KeypadMapId

Property Name	Value
Description:	The keypad map used by this location. The keypad map specifies the numeric keys to which the letters Q and Z are assigned to on the phone. This is specified during Cisco Unity Connection setup.
Notes:	Values: 1: Map 1 - letter Q is mapped to the 7 key, Z to the 9 key. 2: Map 2 - letters Q and Z are mapped to the 1 key. 3: Map 3 - letters Q and Z are mapped to the 0 key.
Business Rules:	
Developer Notes:	Moved from tbl_Location
Table/Column Mapping:	tbl_LocationVMS.KeypadMapId
Primary Key:	False
Allow Null:	False
Default Value:	1

LastLicenseEvalTime

Property Name	Value
Description:	The last time the license evaluation was done.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.LastLicenseEvalTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocalPhonePrefix

Property Name	Value
Description:	<p>The number that is used to construct addresses for Cisco Unity Connection subscribers who send messages to individuals who use the voice messaging system that corresponds to this delivery location.</p> <p>On outgoing messages from Cisco Unity Connection subscribes to subscribers at this VPIM location, the prefix is added to the beginning of the sender mailbox number to form the From address.</p> <p>On incoming messages to Cisco Unity Connection subscribers from subscribers at this VPIM location, the prefix is removed from the beginning of the recipient mailbox number to form the To address.</p>
Notes:	<p>For example, if a subscriber extension is 1234 and their full phone number is 2065551234, the LocalPhonePrefix would be 206555.</p> <p>This is used currently for addressing via VPIM to other systems, but may see other use moving forward.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.LocalPhonePrefix
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Digits 0-9 only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxContacts

Property Name	Value
Description:	The maximum number of contacts that can be created for this location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.MaxContacts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxGreetingLength

Property Name	Value
Description:	The maximum length (in seconds) allowed for recording a system greeting.
Notes:	
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_LocationVMS.MaxGreetingLength
Primary Key:	False
Allow Null:	False
Default Value:	90
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	1200

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a LocationVMS object.
Notes:	The value of this objectid is the same as the tbl_Location.ObjectId.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OverallLicenseState

Property Name	Value
Description:	Specifies the overall license state. It is valid if none of the license feature is in shutdown state. When this state becomes shutdown, the application will be shutdown.
Notes:	Values: 0: Unknown - not evaluated 1: Evaluated and is valid 2: Violated - system will shutdown after grace period expires since ComplianceTime 3: Grace period has expired and system will be shutdown
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.OverallLicenseState
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	LicenseStatus
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyLocalCACertificate

Property Name	Value
Description:	The X.509 certificate formatted as a PEM format string (base-64 encoded).
Notes:	
Business Rules:	Pertinent only if telephony integration method is Skinny.
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCACertificate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (8000 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	8000 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

SkinnyLocalCACertificateFileName

Property Name	Value
Description:	The file name that should be assigned to the SkinnyLocalCACertificate to install the certificate on the Cisco Unified Communications Manager server(s). Installing the certificate on the CCM servers causes CCM to trust any Skinny device certificates signed by it, which is what we need to establish TLS Skinny connections to the CCM servers in the cluster.
Notes:	
Business Rules:	
Developer Notes:	The file name is calculated by same component that generates the value of SkinnyLocalCACertificate. The file name is the hash of the certificate subject with ".0" appended.
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCACertificateFileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyLocalCAPrivateKey

Property Name	Value
Description:	The RSA private key matching the public key in SkinnyDeviceCertificate in PEM format (base-64 encoded string).
Notes:	
Business Rules:	Pertinent only if telephony integration method is Skinny.
Developer Notes:	The key is encrypted using a symmetric algorithm known to the key generation facility and the Skinny TSP.
Table/Column Mapping:	tbl_LocationVMS.SkinnyLocalCAPrivateKey
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (8000 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters

SmtplibDomain

Property Name	Value
Description:	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtplibAddress).
Notes:	<p>The domain name is required by UMSS, and for the VPIM networking options. Both of these networking options use the Simple Mail Transfer Protocol (SMTP) for messaging between the local Cisco Unity Connection VMS server and the remote voice messaging system. When a subscriber on the local Cisco Unity Connection VMS server addresses a message to a remote user, Cisco Unity Connection uses the SMTP Domain Name to construct a From address, which is required by SMTP. Messages that are missing the domain name in the From address will not be delivered. Additionally, a valid From address allows the remote recipient to reply to the message.</p> <p>The syntax specification for this column is based on RFC 1035 (Domain Names - Implementation and Specification) and RFC 2282 (Internet Message Format). The syntax allows "host name" and FQDN as valid domain name.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.SmtplibDomain
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DomainName
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^([a-zA-Z]([a-zA-Z\d]*[a-zA-Z\d])?.)+([a-zA-Z\d])+\$

Property Name	Value
Validation - Description:	<code><domain> ::= <subdomain> " "</code> <code><subdomain> ::= <label> <subdomain> "." <label></code> <code><label> ::= <letter> [[<ldh-str>] <let-dig>]</code> <code><ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str></code> <code><let-dig-hyp> ::= <let-dig> "-"</code> The labels must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	255 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtSmartHost

Property Name	Value
Description:	IP address or host name of SMTP smart host.
Notes:	IPv6 addresses not supported.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.SmtSmartHost
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	The TimeZone associated with this VMS.
Notes:	Refers to entry in tbl_TimeZone table.
Business Rules:	

Property Name	Value
Developer Notes:	Default to 4 (PST) to ensure it is non-NULL. We set it from the OS during setup.
Table/Column Mapping:	tbl_LocationVMS.TimeZone
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferDialString

Property Name	Value
Description:	The phone number that a local Cisco Unity Connection VMS server dials to transfer a call to this Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferDialString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferNumberOfRings

Property Name	Value
Description:	The number of rings the local Cisco Unity Connection VMS server waits for this Cisco Unity Connection VMS server to answer. If this Cisco Unity Connection VMS server does not answer after the specified number of rings, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferNumberOfRings
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TransferTimeout

Property Name	Value
Description:	The amount of time (in milliseconds) the local Cisco Unity Connection VMS server will wait for a response from this Cisco Unity Connection VMS server after this Cisco Unity Connection VMS server has answered the call. If this VMS server does not respond within the specified time period, a prompt is played that says that the Cisco Unity Connection VMS server could not be reached, and the call is transferred to the opening greeting of the local Cisco Unity Connection VMS server.
Notes:	Used with Cisco Unity Connection cross-server logon, transfer and live reply features.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVMS.TransferTimeout
Primary Key:	False
Allow Null:	False
Default Value:	5000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded voice name for the location
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.95. vw_LocationVPIM

An object representing another voice messaging system to which Unity Connection can exchange messages via the VPIM protocol. This object is a sub-class of tbl_Location.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AudioFormatIncoming	smallint (2 bytes)	An enumeration indicating whether incoming VPIM messages from the remote system corresponding to this location should be converted to another audio format.	VpimAudio-FormatIncoming
	AudioFormatOutgoing	smallint (2 bytes)	An enumeration indicating whether VPIM messages from Unity to the remote system corresponding to this location should be converted to another audio format.	VpimAudio-FormatOutgoing
	AutoCreateDisplay-NameRule	varchar (128 characters)	Indicates how text names on incoming messages will be mapped to the display name for auto-created contacts. A value of NULL indicates the text name is mapped directly to the display name of the contact. A non-null value indicates this is a custom rule that defines the mapping of the text name to the display name. Example: <FirstName>, <LastName>	
	AutoCreateExtension-Rule	smallint (2 bytes)	An enumeration indicating how the phone number on incoming VPIM messages should be mapped to the extension for the auto-created contact.	VpimAuto-CreateExtensionRule
	ContactTemplateObject-Id	char (36 characters)	The template upon which to base new contacts created whose destination for messages is this LocationVPIM.	ObjectID
	DestinationType	int (4 bytes)	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.	Destination-Type
	DialingDomainName	nvarchar (40 characters)	The name of the dialing domain of which this location is a member.	
	DisplayName	nvarchar (64 characters)	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId

Key	Name	SQL Data Type/Length	Description	Custom Type
	EnableAGC	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should apply software-based gain control to messages received from this VPIM location.	Bool
	EnableAutoCreateContact	smallint (2 bytes)	A flag indicating whether a contact is automatically created when messages are received from senders at this location.	Bool
	EnableAutoCreateNoVoiceName	smallint (2 bytes)	A flag indicating whether a contact is automatically created/updated when the incoming VPIM message does not include a recorded voice name.	Bool
	EnableAutoDeleteContact	smallint (2 bytes)	A flag indicating whether a contact is automatically deleted when an NDR is received.	Bool
	EnableAutoUpdateContact	smallint (2 bytes)	An enumeration indicating whether a contact is automatically updated when messages are received from senders at this location, and if so, under what condition the contact is updated.	VpimEnableAutoUpdateContact
	EnableAutoUpdateContactDisplayName	smallint (2 bytes)	A flag indicating whether a contact's display name is updated when a contact is automatically updated.	Bool
	EnableOutgoingPrivateMessages	smallint (2 bytes)	A flag indicating whether outgoing messages can be marked "Private."	Bool
	EnableOutgoingSecureMessages	smallint (2 bytes)	A flag indicating whether outgoing messages can be marked "Secure."	Bool
	IncludeSenderVoiceName	smallint (2 bytes)	A flag indicating whether Unity adds the sender's recorded voice name to an outgoing VPIM message.	Bool
	IpAddress	varchar (40 characters)	The IP address of the VPIM server for this location.	IPAddress
	LastDirectoryPushDate	datetime (8 bytes)	The time and date of the last manual directory push to this VPIM location. NULL indicates no push has taken place.	
	ListContactsInDirectory	smallint (2 bytes)	A flag indicating whether a contact should be listed in the phone directory for outside callers, when a contact is automatically created. Default value is 0. Values: 0: Do not list contact in directory 1: List contact in directory	Bool
	LocalPhonePrefix	varchar (64 characters)	The number used to construct addresses for contacts who use the voice messaging system that corresponds to this location. NULL is allowed.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Contact object	ObjectID
	PushDirectory	smallint (2 bytes)	Tells SMTP service whether or not to execute a manual directory push to this VPIM location.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	RemotePhonePrefix	varchar (64 characters)	The number used to construct addresses for contacts who use the voice messaging system that corresponds to this location. NULL is allowed.	
	SmtpDomain	varchar (255 characters)	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtpAddress).	DomainName
	UseSmartSmtpHost	smallint (2 bytes)	A flag indicating whether the Unity Connection SMTP server forwards messages to the SMTP Smart Host for delivery. Values: 0: Do not forward to SMTP Smart Host 1: Forward message to SMTP Smart Host	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_LocationVPIMCreate	Creates a new LocationVPIM object by inserting a new row into tbl_LocationVPIM. A corresponding base Location object is also created in tbl_Location by executing csp_LocationCreate.
csp_LocationVPIMDelete	Deletes a LocationVPIM object from tbl_LocationVPIM as specified by the @ObjectId parameter.
csp_LocationVPIMModify	Updates the attributes of a LocationVPIM object and those attributes of a Location object relevant based on the values passed in via the parameters. The @ObjectId parameter identifies the LocationVPIM and Location objects that are updated.

Column Properties

AudioFormatIncoming

Property Name	Value
Description:	An enumeration indicating whether incoming VPIM messages from the remote system corresponding to this location should be converted to another audio format.
Notes:	Values: 0: No conversion 1: System default
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.AudioFormatIncoming
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	VpimAudioFormatIncoming
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AudioFormatOutgoing

Property Name	Value
Description:	An enumeration indicating whether VPIM messages from Unity to the remote system corresponding to this location should be converted to another audio format.
Notes:	Values: 0: No conversion. 1: System default
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.AudioFormatOutgoing
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	VpimAudioFormatOutgoing
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AutoCreateDisplayNameRule

Property Name	Value
Description:	Indicates how text names on incoming messages will be mapped to the display name for auto-created contacts. A value of NULL indicates the text name is mapped directly to the display name of the contact. A non-null value indicates this is a custom rule that defines the mapping of the text name to the display name. Example: <FirstName>, <LastName>
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.AutoCreateDisplayNameRule
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (128 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AutoCreateExtensionRule

Property Name	Value
Description:	An enumeration indicating how the phone number on incoming VPIM messages should be mapped to the extension for the auto-created contact.
Notes:	Values: 0: Extension is same as phone number 1: Form extension by removing remote phone prefix from phone number 2: Form extension by adding location dial ID in front of phone number 3: Form extension by removing remote phone prefix from phone number, and then add location dial ID in front of phone number
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.AutoCreateExtensionRule
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	VpimAutoCreateExtensionRule
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ContactTemplateObjectId

Property Name	Value
Description:	The template upon which to base new contacts created whose destination for messages is this LocationVPIM.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.ContactTemplateObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestinationType

Property Name	Value
Description:	For delivery locations, the destination type for that location, e.g. SMTP, AMIS, VPIM, Bridge.
Notes:	Values: 1: Cisco Unity Connection location. 2: SMTP location. 5: AMIS location. 7: Cisco Unity Connection Bridge. 8: VPIM location.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.DestinationType
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	DestinationType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialingDomainName

Property Name	Value
Description:	The name of the dialing domain of which this location is a member.
Notes:	<p>A dialing domain is a collection of Unity VMS servers for which access codes or any other type of prefixing is not required to dial between the subscribers that are homed on each VMS server. A dialing domain provides a means to set the search scope for message addressing and for call transfers from the auto attendant and directory handler(s).</p> <p>Note that the dialing domain name is case sensitive and must be entered the same on all Cisco Unity Connection VMS servers that are members of the dialing domain.</p> <p>There is no limit to the number of Cisco Unity Connection VMS servers that can be assigned to a single dialing domain, and there is no limit to the number of dialing domains. However, a Cisco Unity Connection VMS server can be a member of only one dialing domain.</p>
Business Rules:	A Cisco Unity Connection VMS server can be a member of only one dialing domain.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DialingDomainName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this Location, e.g. "Seattle Office." Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	The name of a location must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_Location.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)

Property Name	Value
Validation - Expression:	^[a-zA-Z0-9\-_\.@,;\+\\ %\?\\(\)~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAGC

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should apply software-based gain control to messages received from this VPIM location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableAGC
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAutoCreateContact

Property Name	Value
Description:	A flag indicating whether a contact is automatically created when messages are received from senders at this location.
Notes:	Values: 0: A contact is not created when messages are received from senders at this location. 1: A contact is automatically created when messages are received from senders at this location.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_LocationVPIM.EnableAutoCreateContact
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAutoCreateNoVoiceName

Property Name	Value
Description:	A flag indicating whether a contact is automatically created/updated when the incoming VPIM message does not include a recorded voice name.
Notes:	Values: 0: A contact is not automatically created/updated when the incoming VPIM message does not include a recorded voice name. 1: A contact is automatically created/updated when the incoming VPIM message does not include a recorded voice name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableAutoCreateNoVoiceName
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAutoDeleteContact

Property Name	Value
Description:	A flag indicating whether a contact is automatically deleted when an NDR is received.
Notes:	Values: 0: Contact is not deleted when an NDR is received. 1: Contact is automatically deleted when an NDR is received.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableAutoDeleteContact
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAutoUpdateContact

Property Name	Value
Description:	An enumeration indicating whether a contact is automatically updated when messages are received from senders at this location, and if so, under what condition the contact is updated.
Notes:	Values: 0: No automatic update of contacts 1: Automatically update contact only when the text name changes 2: Automatically update contact with each VPIM message
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableAutoUpdateContact
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	VpimEnableAutoUpdateContact
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableAutoUpdateContactDisplayName

Property Name	Value
Description:	A flag indicating whether a contact's display name is updated when a contact is automatically updated.
Notes:	Values: 0: Contact's display name is not updated when a contact is automatically updated. However, when a contact is automatically updated, the contact's first name, last name, recorded voice name will be updated. 1: Contact's display name is updated when a contact is automatically updated.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableAutoUpdateContactDisplayName
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableOutgoingPrivateMessages

Property Name	Value
Description:	A flag indicating whether outgoing messages can be marked "Private."
Notes:	Values: 0: Outgoing messages cannot be marked "private." 1: Outgoing messages can be marked "private."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableOutgoingPrivateMessages
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableOutgoingSecureMessages

Property Name	Value
Description:	A flag indicating whether outgoing messages can be marked "Secure."
Notes:	Values: 0: Outgoing messages cannot be marked "secure." 1: Outgoing messages can be marked "secure."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.EnableOutgoingSecureMessages
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeSenderVoiceName

Property Name	Value
Description:	A flag indicating whether Unity adds the sender's recorded voice name to an outgoing VPIM message.

Property Name	Value
Notes:	Values: 0: Do not include sender's voice name with outgoing VPIM message 1: Include sender's voice name with outgoing VPIM message
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.IncludeSenderVoiceName
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IpAddress

Property Name	Value
Description:	The IP address of the VPIM server for this location.
Notes:	IPv6 addresses not permitted yet.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.IpAddress
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	IPAddress
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	^0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\.0*([1-9]?[d 1\d 2[0-4]\d 25[0-5])\$
Validation - Description:	IPv4 Address= X.X.X.X where X=0..255. Allows the use of leading zeros. For example, 019.021.055.001
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastDirectoryPushDate

Property Name	Value
Description:	The time and date of the last manual directory push to this VPIM location. NULL indicates no push has taken place.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.LastDirectoryPushDate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ListContactsInDirectory

Property Name	Value
Description:	A flag indicating whether a contact should be listed in the phone directory for outside callers, when a contact is automatically created. Default value is 0. Values: 0: Do not list contact in directory 1: List contact in directory
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.ListContactsInDirectory
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocalPhonePrefix

Property Name	Value
Description:	The number used to construct addresses for contacts who use the voice messaging system that corresponds to this location. NULL is allowed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.LocalPhonePrefix
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Contact object
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PushDirectory

Property Name	Value
Description:	Tells SMTP service whether or not to execute a manual directory push to this VPIM location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.PushDirectory
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RemotePhonePrefix

Property Name	Value
Description:	The number used to construct addresses for contacts who use the voice messaging system that corresponds to this location. NULL is allowed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.RemotePhonePrefix

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtDomain

Property Name	Value
Description:	The domain portion (right-half) of an internet-addressable address (for example, london.cisco.com). This is used to form a user's, contact's, and distribution list's SMTP address (tbl_Alias.SmtAddress).
Notes:	<p>The domain name is required by UMSS, and for the VPIM networking options. Both of these networking options use the Simple Mail Transfer Protocol (SMTP) for messaging between the local Cisco Unity Connection VMS server and the remote voice messaging system. When a subscriber on the local Cisco Unity Connection VMS server addresses a message to a remote user, Cisco Unity Connection uses the SMTP Domain Name to construct a From address, which is required by SMTP. Messages that are missing the domain name in the From address will not be delivered. Additionally, a valid From address allows the remote recipient to reply to the message.</p> <p>The syntax specification for this column is based on RFC 1035 (Domain Names - Implementation and Specification) and RFC 2282 (Internet Message Format). The syntax allows "host name" and FQDN as valid domain name.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Location.SmtDomain
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DomainName
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^([a-zA-Z](\-[a-zA-Z\d]*[a-zA-Z\d])?.)([a-zA-Z\d])+\$.

Property Name	Value
Validation - Description:	<code><domain> ::= <subdomain> " "</code> <code><subdomain> ::= <label> <subdomain> "." <label></code> <code><label> ::= <letter> [[<ldh-str>] <let-dig>]</code> <code><ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str></code> <code><let-dig-hyp> ::= <let-dig> "-"</code> The labels must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	255 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UseSmartSmtpHost

Property Name	Value
Description:	A flag indicating whether the Unity Connection SMTP server forwards messages to the SMTP Smart Host for delivery. Values: 0: Do not forward to SMTP Smart Host 1: Forward message to SMTP Smart Host
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocationVPIM.UseSmartSmtpHost
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.96. vw_LoggerDiagnosticGrid

A simple view for tbl_LoggerDiagnosticGrid.
Diagnostic data used by the Log Manager and the UDT.

Additional Information

This information was formerly stored in the registry under AvLogMgr\Diagnostic Grid. Only the flags, default flags and date/time of last change are stored here. The level descriptions are in an external XML file, which is only used by the UDT.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DefaultFlags	int (4 bytes)	The default grid flags.	
	Flags	int (4 bytes)	The current grid flags.	
	LastChange	datetime (8 bytes)	The date and time of the last change.	
	Name	nvarchar (64 characters)	The text name of the diagnostic grid.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a LoggerDiagnosticGrid object.	ObjectID

Stored Procedures

Name	Description
csp_LoggerDiagnosticGridModify	Updates the attributes of a LoggerDiagnosticGrid object based on the values passed in via the parameters. The @ObjectId parameter identifies the LoggerDiagnosticGrid object that is updated.

Column Properties

DefaultFlags

Property Name	Value
Description:	The default grid flags.
Notes:	
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_LoggerDiagnosticGrid.DefaultFlags
Primary Key:	False
Allow Null:	False
Default Value:

Validation - Maximum Value:	

Flags

Property Name	Value
Description:	The current grid flags.
Notes:	If NULL, use DefaultFlags.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LoggerDiagnosticGrid.Flags
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastChange

Property Name	Value
Description:	The date and time of the last change.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	Currently Optional: to replace broadcast setting in tbl_Configuration. This value will be maintained by the stored procedures.
Table/Column Mapping:	tbl_LoggerDiagnosticGrid.LastChange
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Name

Property Name	Value
Description:	The text name of the diagnostic grid.
Notes:	This value must match the exact name attribute of the DiagnosticGrid in the DiagnosticGrids_XXX.xml file.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LoggerDiagnosticGrid.Name
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a LoggerDiagnosticGrid object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_LoggerDiagnosticGrid.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.97. vw_LoggerJavaMapping

Simple view for tbl_LoggerJavaMapping

Maps java classes and packages to a logger index from 0 to 31 on a diagnostic grid.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Classes	lvarchar (2048 characters)	Java classes and packages to map to this flag (comma separated).	
PK	Flag	int (4 bytes)	Diagnostic flag this corresponds to (from 0 to 31).	
PK	LoggerDiagnostic-GridObjectId	char (36 characters)	Diagnostic grid this mapping is associated with.	ObjectID
	OffLevel	smallint (2 bytes)		JavaLogLevel
	OnLevel	smallint (2 bytes)		JavaLogLevel

Stored Procedures

Name	Description

Column Properties

Classes

Property Name	Value
Description:	Java classes and packages to map to this flag (comma separated).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LoggerJavaMapping.Classes
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:

Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.98. vw_Mailbox

A mapping between a user and their mailbox in the Unity Message Store Solution (UMSS) or other message store such as Exchange or Domino.

Additional Information

This view is comprised of all the columns in the tbl_MailboxMap table for a user object that is NOT a template.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	IsPrimary	smallint (2 bytes)	A flag indicating whether this mailbox is the primary mailbox of the user.	Bool
	LastGuiAccessTime	datetime (8 bytes)	The last time the user accessed their this mailbox through the GUI.	
	LastTuiAccessTime	datetime (8 bytes)	The last time the user accessed their this mailbox through the TUI.	
PK	MailboxId	nvarchar (110 characters)	The identifier of a single mailbox on the specified mailbox store.	
	MailboxLoginType	int (4 bytes)	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it)	MailboxLoginType
	MailboxPassword	varchar (254 characters)	For non-UMSS mailbox stores, the password for conversations to use to logon and retrieve messages.	
PK	MailboxStoreObjectId	char (36 characters)	The unique identifier of the MailboxStore object to which this mailbox belongs.	ObjectID
	UserObjectId	char (36 characters)	The unique identifier of the User account object to which this mailbox belongs.	ObjectID
	WebdavUrl	lvarchar (256 characters)	Relative URL for mailbox access on server.	

Stored Procedures

Name	Description
csp_MailboxMapCreate	Creates a mapping of a user with their mailboxid in Unity Message Store Solution (UMSS) or other message store such as Exchange or Domino.
csp_MailboxMapDelete	Deletes a specified mapping of a mailbox with a user.
csp_MailboxMapModify	Updates the attributes of a specified instance of a MailBoxMap object based on the values passed in via the parameters.

Column Properties

IsPrimary

Property Name	Value
Description:	A flag indicating whether this mailbox is the primary mailbox of the user.
Notes:	
Business Rules:	User must have one and only one primary mailbox.
Developer Notes:	In the future, users will be allowed to have more than a single mailbox.
Table/Column Mapping:	tbl_MailboxMap.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastGuiAccessTime

Property Name	Value
Description:	The last time the user accessed their this mailbox through the GUI.
Notes:	A NULL value indicates the mailbox has never been access via the GUI. Timestamp stored in GMT.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastGuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

LastTuiAccessTime

Property Name	Value
Description:	The last time the user accessed their this mailbox through the TUI.
Notes:	A NULL value indicates the mailbox has never been access via the TUI. Timestamp stored in GMT.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastTuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MailboxId

Property Name	Value
Description:	The identifier of a single mailbox on the specified mailbox store.
Notes:	For users with mailboxes on UMSS, the objectid of the UMSS mailbox object is contained here. For users with mailboxes on an other mail store such as Exchange or Domino, the user's legacy Exchange DN or primary SMTP address is stored here.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	

Property Name	Value
SQL Data Type/Length:	nvarchar (110 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	110 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MailboxLoginType

Property Name	Value
Description:	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it)
Notes:	Applies only to MPE currently. Values: 0: Users alias used for login 1: Login as guest 2: Login using mailboxid (or part of it)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxLoginType
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailboxLoginType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MailboxPassword

Property Name	Value
Description:	For non-UMSS mailbox stores, the password for conversations to use to logon and retrieve messages.
Notes:	Encrypted/decrypted by clients.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxPassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MailboxStoreObjectId

Property Name	Value
Description:	The unique identifier of the MailboxStore object to which this mailbox belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxStoreObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User account object to which this mailbox belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:

5.100. vw_MailboxStoreMap

A simple view for tbl_MailboxStoreMap.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DbInstance	lvarchar (256 characters)	The name of the dbinstance on which the mailbox store resides.	
	DialString	nvarchar (40 characters)	The number dialed by Unity Connection to access the Cisco Unified MeetingPlace Express system.	PhoneNumberE123
	DisplayName	nvarchar (64 characters)	A descriptive name for the Message Store.	
	MailboxStoreType	int (4 bytes)	The type of mailbox store (e.g., UMSS).	MailboxStore-Type
	MailDatabase	lvarchar (512 characters)	The name of the mailbox database, such as "UnityMbxDb1."	
	Mounted	smallint (2 bytes)	A flag indicating whether the mailbox store is mounted.	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MailboxStore object.	ObjectID
	RequiredSecurity	int (4 bytes)	The method of encryption that Cisco Unity Connection will use on a mailstore connection.	MailstoreCon- nectionEn- ryption
	Server	lvarchar (256 characters)	The name of the server on which the mailbox store resides.	
	ServiceAlias	lvarchar (256 characters)	The unique text name (alias) for a service to use to logon to mailbox store for message retrieval.	
	ServicePassword	varchar (254 characters)	The password for a service to use to logon to mailbox store for message retrieval.	

Stored Procedures

Name	Description
csp_MailboxStoreMapCreate	Creates a new MailboxStoreMap object by inserting a new row into tbl_MailboxStoreMap. A MailboxStoreMap object maps a mailbox database with a grouping of mailboxes for administrative purposes.

Name	Description
csp_MailboxStoreMapDelete	Deletes a MailboxStoreMap object from tbl_MailboxStoreMap as specified by the @ObjectId parameter.
csp_MailboxStoreMapModify	Updates the attributes of a MailboxStoreMap object based on the values passed in via the parameters. The @ObjectId parameter identifies the MailboxStoreMap object that is updated.

Column Properties

DbInstance

Property Name	Value
Description:	The name of the dbinstance on which the mailbox store resides.
Notes:	
Business Rules:

MailboxStoreType

Property Name	Value
Description:	The type of mailbox store (e.g., UMSS).

Property Name	Value
Notes:	Values: 0: UMSS - Cisco Unity Connection message store solution. 1: IMAP - external, non-UMSS, mailstore accessed via IMAP. 2: POP3 - external, non-UMSS, mailstore accessed via POP3. 3: WebDAV - used to retrieve personal contacts (although could potentially be used to get messages) 4: Used by the Common Calendaring Library to retrieve calendaring and meeting information from the Meeting Place Express web service.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.MailboxStoreType
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailboxStoreType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MailDatabase

Property Name	Value
Description:	The name of the mailbox database, such as "UnityMbxDb1."
Notes:	A VMS can contain multiple mailbox databases. For UMSS, all the mailbox databases are a single instance of SqlServer, but each mailbox database must have a unique name. For UMSS, mailbox database is a conceptual grouping of a Mail Information Store and a Mail Attachment Store pair. Voice Message Header information is stored within the Mail Information Store, while Voice Message Attachment information is stored the Mail Attachment store. See UMSS section of the data dictionary for more information.
Business Rules:	
Developer Notes:	For external IMAP mailstores this value will be NULL.
Table/Column Mapping:	tbl_MailboxStoreMap.MailDatabase
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (512 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	512 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Mounted

Property Name	Value
Description:	A flag indicating whether the mailbox store is mounted.
Notes:	Clients should check this setting before accessing the mailbox store database. Tools can set it to denote that a mailbox store is offline when offline database maintenance needs to be performed.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Mounted
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MailboxStore object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ObjectId
Primary Key:	True

Property Name	Value
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiredSecurity

Property Name	Value
Description:	The method of encryption that Cisco Unity Connection will use on a mailstore connection.
Notes:	Values: 0: No encryption. 1: TLS level encryption. 2: SSL encryption. 3: IPSec encryption.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.RequiredSecurity
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailstoreConnectionEncryption
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Server

Property Name	Value
Description:	The name of the server on which the mailbox store resides.
Notes:	For UMSS, the server name within the VMS configuration.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Server
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ServiceAlias

Property Name	Value
Description:	The unique text name (alias) for a service to use to logon to mailbox store for message retrieval.
Notes:	Must have access to all users messages ("superuser").
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ServiceAlias
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:

5.101. vw_MediaPort

A representation of a single generalized phone line/station. Cisco Unity Connection uses the configuration settings in this table to emulate a single generalized phone line/station.

Additional Information

This view is comprised of all the columns in the tbl_MediaPort table along with the following columns:

- * ObjectId and DisplayName of the parent MediaPortGroup
- * ObjectId and DisplayName of the parent MediaSwitch
- * PIMG port number
- * The Skinny device name

The DisplayName column includes the name of the port along with its port number formatted as <tbl_MediaPort.DisplayName> + '-' + <tbl_MediaPort.PortNumInGroup>.

Note several columns are calculated using columns from MediaPortGroup.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CapAnswer	smallint (2 bytes)	A flag indicating whether the media port is capable of answering calls.	Bool
	CapDeliverAmis	smallint (2 bytes)	A flag indicating whether the media port is capable of performing the function of delivering AMIS messages.	Bool
	CapEnabled	smallint (2 bytes)	A flag indicating whether the media port is enabled during normal operation.	Bool
	CapMWI	smallint (2 bytes)	A flag indicating whether the media port is capable of performing the function of turning MWIs on and off.	Bool
	CapNotification	smallint (2 bytes)	A flag indicating whether the media port is capable of performing the function of notifying subscribers of messages.	Bool
	CapTrapConnection	smallint (2 bytes)	A flag indicating whether the media port is capable of performing the function of enabling subscribers to use the phone as a recording and playback device in Cisco Unity Connection web applications and e-mail clients.	Bool
	DisplayName	lvarchar (256 characters)	The name of media port.	MediaPortDisplayName
	Extension	varchar (128 characters)	The dialable number (extension) of this line/port.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	HuntOrder	smallint (2 bytes)	The position of this line in the hunt group as configured on the switch, with the highest numbers representing the lines that are first ("use me first") in the hunt group. Ports can have the same HuntOrder, and in that case ports will be selected on a round-robin (or longest-idle) basis.	
	MediaPortGroupDisplay-Name	nvarchar (64 characters)	The name of the parent MediaPortGroup.	
	MediaPortGroupEnableMWI	smallint (2 bytes)	A flag indicating whether this port group can transmit message waiting indicator (MWI) on/off messages to the switch.	Bool
	MediaPortGroupMwiReqPortSpecific	smallint (2 bytes)	A flag indicating whether MWI requests require a MediaPort.	Bool
	MediaPortGroupObjectId	char (36 characters)	The unique identifier of the MediaPortGroup object to which this port belongs.	ObjectID
	MediaSwitchDisplay-Name	nvarchar (64 characters)	The name of the parent MediaSwitch.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the parent MediaSwitch.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPort object.	ObjectID
	PimgPortNumber	lvarchar (256 characters)	The port number for PIMG.	
	PortNumInGroup	smallint (2 bytes)	The port number of this line as assigned by Cisco Unity Connection.	
	SipSendPort	int (4 bytes)	UDP port for outgoing SIP messages.	
	SkinnyDeviceCertificate	lvarchar (8000 characters)	The X.509 certificate for this device as a PEM format string (base-64 encoded).	
	SkinnyDeviceCertificate-ChangeId	char (36 characters)	A unique identifier used to track changes to SkinnyDeviceCertificate.	ObjectID
	SkinnyDeviceName	lvarchar (256 characters)	For a CCM SCCP integration, the name of the SCCP device.	
	SkinnyDevicePrivateKey	lvarchar (8000 characters)	The RSA private key matching the public key in SkinnyDeviceCertificate in PEM format (base-64 encoded string).	
	SkinnyDevicePrivateKeyChangeId	char (36 characters)	A unique identifier used to track changes to SkinnyDevicePrivateKey.	ObjectID
	SkinnyDoMediaEncryption	smallint (2 bytes)	A flag indicating whether the audio stream between Cisco Unity Connection and the remote endpoint should be encrypted.	Bool
	SkinnySecurityModeEnum	smallint (2 bytes)	The security mode used for Skinny protocol sessions.	SkinnySecurityMode
	TelephonyIntegration-MethodEnum	smallint (2 bytes)	The method used to integrate with the switch.	TelephonyIntegration-Method
	VmsServerObjectId	char (36 characters)	The unique identifier of the VMSServer object to which this line belongs.	ObjectID

Stored Procedures

Name	Description
csp_MediaPortCreate	Creates a new MediaPort object by inserting a new row into tbl_MediaPort.
csp_MediaPortDelete	Deletes a MediaPort object from tbl_MediaPort as specified by the @ObjectId parameter.
csp_MediaPortModify	Updates the attributes of a MediaPort object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaPort object that is updated.

Column Properties

CapAnswer

Property Name	Value
Description:	A flag indicating whether the media port is capable of answering calls.
Notes:	Values: 0: This media port cannot be used to answer calls. 1: This media port can be used to answer calls. NULL means "not valid in this context."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.CapAnswer
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CapDeliverAmis

Property Name	Value
Description:	A flag indicating whether the media port is capable of performing the function of delivering AMIS messages.
Notes:	Values: 0: This media port cannot be used to deliver AMIS messages. 1: This media port can be used to deliver AMIS messages. NULL means "not valid in this context."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.CapDeliverAmis
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CapEnabled

Property Name	Value
Description:	A flag indicating whether the media port is enabled during normal operation.
Notes:	Values: 0: This media port is disabled. Calls to this port get a ringing tone, but are not answered. 1: This media port is enabled.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.CapEnabled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

CapMWI

Property Name	Value
Description:	A flag indicating whether the media port is capable of performing the function of turning MWIs on and off.
Notes:	Values: 0: This media port is not capable of turning MWIs on and off. 1: This media port can be used to turn MWI on and off. NULL means "not valid in this context."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.CapMWI
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CapNotification

Property Name	Value
Description:	A flag indicating whether the media port is capable of performing the function of notifying subscribers of messages.
Notes:	Values: 0: This media port is not capable of being used for message notification. 1: This media port can be used for message notification. NULL means "not valid in this context."
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_MediaPort.CapNotification
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CapTrapConnection

Property Name	Value
Description:	A flag indicating whether the media port is capable of performing the function of enabling subscribers to use the phone as a recording and playback device in Cisco Unity Connection web applications and e-mail clients.
Notes:	<p>Values:</p> <p>0: This media port is not capable of being used to perform Trap connections.</p> <p>1: This media port can be used to perform Trap connections.</p> <p>NULL means "not valid in this context."</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.CapTrapConnection
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The name of media port.
Notes:	Constructed using: <tbl_MediaPortGroup.DisplayName> + "-" + <tbl_MediaPort.PortNumberInGroup>. For example, if a MediaPort has PortNumInGroup=3 and the parent group has DisplayName="MyPortGroup", the display name for the port is "MyPortGroup-3". See "PortNumInGroup" for more information.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	MediaPortDisplayName
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Extension

Property Name	Value
Description:	The dialable number (extension) of this line/port.
Notes:	For Cisco Unified Communications Manager, this is a directory number (DN). Does not apply to SIP integrations.
Business Rules:	Pertinent forTelephonyIntegrationMethodEnum NOT= SIP.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.Extension
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (128 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Digits only
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

HuntOrder

Property Name	Value
Description:	The position of this line in the hunt group as configured on the switch, with the highest numbers representing the lines that are first ("use me first") in the hunt group. Ports can have the same HuntOrder, and in that case ports will be selected on a round-robin (or longest-idle) basis.
Notes:	<p>To determine what port to use for an outgoing call or MWI request, the Resource Manager examines the HuntOrder of all the MediaPort objects that are (1) assigned the switch to which the call or MWI request should be directed and (2) allowed to perform the requested function. The Resource Manager selects the available MediaPort with the highest HuntOrder. Selecting the highest available HuntOrder is intended to avoid collisions with incoming calls, which the switch will tend to direct to the lowest-numbered ports.</p> <p>Thus HuntOrder is a relative ranking between MediaPorts assigned to the same switch. It doesn't necessarily need to exactly match the programming on the switch.</p>
Business Rules:	Hunt order is not available for SIP ports. However, hunt order is available for PIMG ports.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.HuntOrder
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	4096

MediaPortGroupDisplayName

Property Name	Value
Description:	The name of the parent MediaPortGroup.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupEnableMWI

Property Name	Value
Description:	A flag indicating whether this port group can transmit message waiting indicator (MWI) on/off messages to the switch.
Notes:	Values: 0: Cannot transmit MWI 1: Can transmit MWI
Business Rules:	
Developer Notes:	The purpose of this column is to help the SA determine whether to display the capMWI value for the port. It allows them to do so without querying the database to read the port group for each port.
Table/Column Mapping:	tbl_MediaPortGroup.EnableMWI
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupMwiReqPortSpecific

Property Name	Value
Description:	A flag indicating whether MWI requests require a MediaPort.
Notes:	Values: 0: Media port not required for MWI's 1: MWI's require a media port
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	The purpose of this column is to help the SA determine whether to display the capMWI value for the port. It allows them to do so without querying the database to read the port group for each port.
Table/Column Mapping:	tbl_MediaPortGroup.MwiReqPortSpecific
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupObjectId

Property Name	Value
Description:	The unique identifier of the MediaPortGroup object to which this port belongs.
Notes:	FK to MediaPortGroup.ObjectId
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.MediaPortGroupObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:

Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PimgPortNumber

Property Name	Value
Description:	The port number for PIMG.
Notes:	Derived from PortNumInGroup. See "PortNumInGroup" for more information.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	
SQL Data Type/Length:	lvvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PortNumInGroup

Property Name	Value
Description:	The port number of this line as assigned by Cisco Unity Connection.
Notes:	<p>PortNumInGroup is used for two purposes:</p> <ul style="list-style-type: none"> * Derive display name for the port. The display name for a MediaPort object is calculated on the fly by the system (database views) as: [Display name of the parent MediaPortGroup]-[PortNumInGroup]. For example, if a MediaPort has PortNumInGroup=3 and the parent group has DisplayName="MyPortGroup", the display name for the port is "MyPortGroup-3". * PIMG port number (for PIMG integrations only). PIMG devices have eight ports numbered 1-8. <p>PortNumInGroup is assigned by the database when a MediaPort row is inserted. The value cannot be modified. In general, Cisco Unity Connection Administration will create ports so that ports are numbered sequentially starting at one. However, it's possible for a gap in the numbering to be created if the user deletes a port falling in the middle of the sequence.</p>
Business Rules:	Minimum value = 1. For PIMG integrations, maximum value is 8 (use CHECK constraint). Unique [MediaPortGroupObjectId,PortNumInGroup] (in index).
Developer Notes:	Max is 999 because vw_MediaPort formats as three character string
Table/Column Mapping:	tbl_MediaPort.PortNumInGroup
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	999

SipSendPort

Property Name	Value
Description:	UDP port for outgoing SIP messages.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.SipSendPort
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Validation - Minimum Value:	0
Validation - Maximum Value:	65535

SkinnyDeviceCertificate

Property Name	Value
Description:	The X.509 certificate for this device as a PEM format string (base-64 encoded).
Notes:	Used in TLS handshake.
Business Rules:	Pertinent only if TelephonyIntegrationMethodEnum = Skinny
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.SkinnyDeviceCertificate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (8000 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	8000 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyDeviceCertificateChangeId

Property Name	Value
Description:	A unique identifier used to track changes to SkinnyDeviceCertificate.
Notes:	This column is assigned a new value whenever a SkinnyDeviceCertificate is modified.
Business Rules:	
Developer Notes:	Any client (e.g., Modify proc) modifying SkinnyDeviceCertificate is responsible for setting SkinnyDeviceCertificateChangeId to a new value at the same time.
Table/Column Mapping:	tbl_MediaPort.SkinnyDeviceCertificateChangeId
Primary Key:	False
Allow Null:	False
Default Value:

Validation - Maximum Value:	

SkinnyDoMediaEncryption

Property Name	Value
Description:	A flag indicating whether the audio stream between Cisco Unity Connection and the remote endpoint should be encrypted.
Notes:	Values: 0: No encryption - Real-time Transport Protocol (RTP) 1: Encrypted - Secure Real-time Transport Protocol (SRTP)
Business Rules:	Pertinent only if TelephonyIntegrationMethodEnum = Skinny and SkinnySecurityModeEnum is not Insecure.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.SkinnyDoMediaEncryption
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnySecurityModeEnum

Property Name	Value
Description:	The security mode used for Skinny protocol sessions.

Property Name	Value
Notes:	FK to SkinnySecurityModeEnum.Enum Values: 0: Insecure - normal non-TLS connection. 1: Authenticated - TLS connection with cipher NULL-SHA. 2: Encrypted - data is encrypted.
Business Rules:	Pertinent only if TelephonyIntegrationMethodEnum = Skinny.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.SkinnySecurityModeEnum
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	SkinnySecurityMode
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TelephonyIntegrationMethodEnum

Property Name	Value
Description:	The method used to integrate with the switch.
Notes:	TelephonyIntegrationMethodEnum.Enum Values: 1: Skinny Client Control Protocol (SCCP) integration method. 2: Session Initiation Protocol (SIP) integration method. 3: Intel PBX IP Media Gateway (PIMG) integration method.
Business Rules:	Once a instance of this object has been created, this value can never be modified.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.TelephonyIntegrationMethodEnum
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	TelephonyIntegrationMethod
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VmsServerObjectId

Property Name	Value
Description:	The unique identifier of the VMSServer object to which this line belongs.
Notes:	FK to VMSServer.ObjectId
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPort.VmsServerObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

5.106. vw_MediaPortConfigState

A simple view for tbl_MediaPortConfigState.

Rows in this table checkpoint the last change to telephony port settings that require a service restart to take effect.

Additional Information

The checkpoint is stored in NeedRestartId. If this value is different from the corresponding row in

UnityDynDb:tbl_MediaPortState, then a service restart is necessary in order to cause port configuration changes to take effect.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DateModified	datetime (8 bytes)	The date and time this row was inserted or last modified.	
PK	MediaPortObjectId	char (36 characters)	The unique identifier of the MediaPort object to which this state information pertains.	ObjectID
	NeedRestartId	char (36 characters)	The checkpoint of changes to MediaPort settings that require a restart to take effect.	ObjectID
	NeedRestartIdModifiedBy	nvarchar (128 characters)	The name of the entity that last modified this row.	

Stored Procedures

vw_MediaPortConfigState has no stored procedures.

Column Properties

DateModified

Property Name	Value
Description:	The date and time this row was inserted or last modified.
Notes:	Value is set by ON INSERT/UPDATE triggers.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortConfigState.DateModified

Validation - Maximum Value:	

5.107. vw_MediaPortGroup

A view for tbl_MediaPortGroup plus the name of the parent phone system, and the total number of ports belonging to the MediaPortGroup.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AgcTargetDB	smallint (2 bytes)	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.	
	CcmDoAutoFailback	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should automatically re-register (i.e. failback) with a higher-precedence CCM server if one becomes available. This is pertinent if a Cisco Unity Connection Skinny device is currently registered to a CCM server that is not the primary server.	Bool
	DelayBeforeOpeningMs	smallint (2 bytes)	The delay (in milliseconds) after a call is connected before playing the opening greeting.	
	DisplayName	nvarchar (64 characters)	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfDialInterDigit-DelayMs	int (4 bytes)	The amount of time (in milliseconds) between DTMF digits when sending DTMF to the PBX.	
	EnableAGC	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should apply software-based gain control when recording messages.	Bool
	EnableMWI	smallint (2 bytes)	A flag indicating whether this port group can transmit message waiting indicator (MWI) on/off messages to the switch.	Bool
	MediaPortGroupTemplateObjectId	char (36 characters)	The unique identifier of the template from which the MediaPortGroup object was created.	ObjectID
	MediaSwitchDisplay-Name	nvarchar (64 characters)	The name of the parent MediaSwitch.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to which this MediaPortGroup belongs. The MediaSwitch represents the PBX/switch at the other end of the phone lines.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MwiMaxConcurrentRequests	smallint (2 bytes)	The maximum number of MWI requests that can be in progress at any instant.	
	MwiMinRequestIntervalMs	int (4 bytes)	The minimum amount of time (in milliseconds) between sending MWI on/off requests to the switch.	
	MwiOffCode	nvarchar (128 characters)	The access code that Cisco Unity Connection uses to deactivate (extinguish) a message waiting indicator (MWI).	MwiCode
	MwiOnCode	nvarchar (128 characters)	The access code that Cisco Unity Connection uses to activate (light) a message waiting indicator (MWI).	MwiCode
	MwiReqPortSpecific	smallint (2 bytes)	A flag indicating whether MWI requests require a MediaPort.	Bool
	MwiRetryCountOnSuccess	smallint (2 bytes)	The number of times Cisco Unity Connection should repeat activating/deactivating an MWI upon success.	
	MwiRetryIntervalOnSuccessMs	smallint (2 bytes)	The minimum time interval (in milliseconds) between repeated transmissions of MWI on/off, see MWIRetryIntervalCountOnSuccess.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroup object.	ObjectID
	OutgoingGuardTimeMs	int (4 bytes)	The amount of time (in milliseconds) a port in this group must be on-hook before the Cisco Unity Connection will allow an outgoing call on that port.	
	OutgoingPostDialDelayMs	int (4 bytes)	The delay (in milliseconds) after dialing an outgoing call.	
	OutgoingPreDialDelayMs	int (4 bytes)	The delay (in milliseconds) before dialing.	
	PortCount	int (4 bytes)	The total number of MediaPorts in the MediaPortGroup.	
	PortNumMax	int (4 bytes)	Specifies the maximum allowable value for tbl_MediaPort.PortNumInGroup for rows in that table that belong to this port group. Value of zero means that the number of ports is unlimited, subject to any other restrictions that may apply.	
	SipAuthenticateAsUser	nvarchar (64 characters)	The user name used for SIP authentication.	
	SipAuthenticatePassword	lvarchar (256 characters)	The password to use during SIP authentication.	
	SipContactLineName	nvarchar (64 characters)	The dialable (extension) number of the lines in this group, i.e., pilot number.	
	SipDoAuthenticate	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should authenticate with the remote endpoint.	Bool
	SipRegisterWithProxyServer	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should register with a SIP proxy server.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	SipTransportProtocolEnum	smallint (2 bytes)	The transport protocol Cisco Unity Connection should use for the SIP integration.	SIPTransport-Protocol
	SkinnyDevicePrefix	nvarchar (48 characters)	The prefix Cisco Unity Connection uses to generate Skinny device name for ports belonging to this group.	
	TelephonyIntegration-MethodEnum	smallint (2 bytes)	The method used by lines in this group to integrate with the switch.	TelephonyIntegration-Method
	WaitForCallInfoMs	int (4 bytes)	Number of milliseconds to wait for call information (CallerID, CalledID, etc.) to arrive after answering the call.	

Stored Procedures

Name	Description
csp_MediaPortGroupCreate	Creates a new MediaPortGroup object by inserting a new row into tbl_MediaPortGroup. The new MediaPortGroup object is created by one of three methods: either from a template (tbl_MediaPortGroupTemplate), an existing MediaPortGroup object or from scratch based on the values contained in the input parameters.
csp_MediaPortGroupDelete	Deletes a MediaPortGroup from tbl_MediaPortGroup as specified by the @ObjectId parameter.
csp_MediaPortGroupModify	Updates the attributes of a MediaPortGroup object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaPortGroup object that is updated.

Column Properties

AgcTargetDB

Property Name	Value
Description:	The average decibel (dB) level that a recorded message should have after application of automatic gain control (AGC). This is the "nominal gain" for all recordings processed by AGC.
Notes:	<p>AGC will attempt to modify the incoming recording to match AGCTargetDB. This value is in decibels (dB) relative to the maximum amplitude possible for a PCM-encoded waveform, thus it is always less than zero. Values closer to zero are higher volume. Thus -10 dB is louder than -15 dB.</p> <p>AGC only affects recordings made with Cisco Unity Connection. AGC does not directly affect playback.</p>
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_MediaPortGroup.AgcTargetDB
Primary Key:	False
Allow Null:	False
Default Value:	-26
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	-35
Validation - Maximum Value:	-15

CcmDoAutoFailback

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should automatically re-register (i.e. failback) with a higher-precedence CCM server if one becomes available. This is pertinent if a Cisco Unity Connection Skinny device is currently registered to a CCM server that is not the primary server.
Notes:	Values: 0: Do not failback 1: Failback
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.CcmDoAutoFailback
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DelayBeforeOpeningMs

Property Name	Value
Description:	The delay (in milliseconds) after a call is connected before playing the opening greeting.
Notes:	
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] DelayBeforeOpening.
Table/Column Mapping:	tbl_MediaPortGroup.DelayBeforeOpeningMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

DisplayName

Property Name	Value
Description:	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfDialInterDigitDelayMs

Property Name	Value
Description:	The amount of time (in milliseconds) between DTMF digits when sending DTMF to the PBX.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.DtmfDialInterDigitDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	500

EnableAGC

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should apply software-based gain control when recording messages.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.EnableAGC
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

EnableMWI

Property Name	Value
Description:	A flag indicating whether this port group can transmit message waiting indicator (MWI) on/off messages to the switch.
Notes:	Values: 0: Cannot transmit MWI 1: Can transmit MWI
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.EnableMWI
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupTemplateObjectId

Property Name	Value
Description:	The unique identifier of the template from which the MediaPortGroup object was created.
Notes:	
Business Rules:	
Developer Notes:	No FK/link in case the template is deleted in future release.
Table/Column Mapping:	tbl_MediaPortGroup.MediaPortGroupTemplateObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchDisplayName

Property Name	Value
Description:	The name of the parent MediaSwitch.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to which this MediaPortGroup belongs. The MediaSwitch represents the PBX/switch at the other end of the phone lines.
Notes:	FK to MediaSwitch.ObjectId
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MediaSwitchObjectId
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiMaxConcurrentRequests

Property Name	Value
Description:	The maximum number of MWI requests that can be in progress at any instant.
Notes:	Used for "MWI throttling" feature. A value of 0 that this limitation is not in effect.
Business Rules:	Pertinent only if EnableMWI = TRUE and ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] MaximumConcurrentMWIRequests
Table/Column Mapping:	tbl_MediaPortGroup.MwiMaxConcurrentRequests
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	250

MwiMinRequestIntervalMs

Property Name	Value
Description:	The minimum amount of time (in milliseconds) between sending MWI on/off requests to the switch.
Notes:	
Business Rules:	Pertinent only if EnableMWI = TRUE and ALL integrations.

Property Name	Value
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] MinimumMWIRequestInterval. This is used for MWI throttling.
Table/Column Mapping:	tbl_MediaPortGroup.MwiMinRequestIntervalMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

MwiOffCode

Property Name	Value
Description:	The access code that Cisco Unity Connection uses to deactivate (extinguish) a message waiting indicator (MWI).
Notes:	PIMG feature access code programmed on the PBX. Skinny/CCM: MWI DN programmed on the cluster.
Business Rules:	Does not apply to SIP or PIMG integrations (Cisco Unity Connection ignores value). For other integration types, pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MwiOffCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	MwiCode
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[0-9A-Za-zPpTtXx#*,]*\$
Validation - Description:	Standard dialstring characters: 0-9, A-D, #, *, comma (pause) and X (primary DTMF ID for subscriber), T (touchtone dialing) and P (pulse dialing).
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiOnCode

Property Name	Value
Description:	The access code that Cisco Unity Connection uses to activate (light) a message waiting indicator (MWI).
Notes:	<ul style="list-style-type: none"> * PIMG: feature access code programmed on the PBX. * Skinny/CCM: MWI DN programmed on the cluster.
Business Rules:	Does not apply to SIP or PIMG integrations (Unity ignores value). For other integration types, pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MwiOnCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	MwiCode
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[0-9A-Da-dPpTtXx#*,]*\$
Validation - Description:	Standard dialstring characters: 0-9, A-D, #, *, comma (pause) and X (primary DTMF ID for subscriber), T (touchtone dialing) and P (pulse dialing).
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiReqPortSpecific

Property Name	Value
Description:	A flag indicating whether MWI requests require a MediaPort.
Notes:	Values: 0: Media port not required for MWI's 1: MWI's require a media port
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MwiReqPortSpecific
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiRetryCountOnSuccess

Property Name	Value
Description:	The number of times Cisco Unity Connection should repeat activating/deactivating an MWI upon success.
Notes:	
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MwiRetryCountOnSuccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10

MwiRetryIntervalOnSuccessMs

Property Name	Value
Description:	The minimum time interval (in milliseconds) between repeated transmissions of MWI on/off, see MWIRetryIntervalCountOnSuccess.
Notes:	
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.MwiRetryIntervalOnSuccessMs
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

OutgoingGuardTimeMs

Property Name	Value
Description:	The amount of time (in milliseconds) a port in this group must be on-hook before the Cisco Unity Connection will allow an outgoing call on that port.
Notes:	
Business Rules:	
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingGuardTime.
Table/Column Mapping:	tbl_MediaPortGroup.OutgoingGuardTimeMs

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	2500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10000

OutgoingPostDialDelayMs

Property Name	Value
Description:	The delay (in milliseconds) after dialing an outgoing call.
Notes:	
Business Rules:	
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingPostDialDelayMs.
Table/Column Mapping:	tbl_MediaPortGroup.OutgoingPostDialDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

OutgoingPreDialDelayMs

Property Name	Value
Description:	The delay (in milliseconds) before dialing.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingPreDialDelayMs.
Table/Column Mapping:	tbl_MediaPortGroup.OutgoingPreDialDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

PortCount

Property Name	Value
Description:	The total number of MediaPorts in the MediaPortGroup.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PortNumMax

Property Name	Value
Description:	Specifies the maximum allowable value for tbl_MediaPort.PortNumInGroup for rows in that table that belong to this port group. Value of zero means that the number of ports is unlimited, subject to any other restrictions that may apply.
Notes:	This column comes into play for PIMG port groups (TelephonyIntegrationMethodEnum = 3) It functions as an aid to the Cisco Unity administrator by not permitting the administrator to configure more Cisco Unity telephony ports than the number of ports available on the PIMG or TIMG device. For other types of port groups, the value of this column is typically set to zero by the port group template, which disables the restriction.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.PortNumMax
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	256

SipAuthenticateAsUser

Property Name	Value
Description:	The user name used for SIP authentication.
Notes:	
Business Rules:	Pertinent only if SIPDoAuthenticate=TRUE, in which case should not be empty.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SipAuthenticateAsUser
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[\\p{L}\\p{Digit}`~!@#%\$%^&x26\\-_{} \\.,']*
Validation - Description:	Any ASCII or unicode alphabetical or numeric character; special characters ` , ~ , ! , @ , # , \$, % , ^ , & , - , _ , ' , period, comma, and space.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

SipAuthenticatePassword

Property Name	Value
Description:	The password to use during SIP authentication.
Notes:	This is encrypted.
Business Rules:	Pertinent only if SIPDoAuthenticate=TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SipAuthenticatePassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SipContactLineName

Property Name	Value
Description:	The dialable (extension) number of the lines in this group, i.e., pilot number.
Notes:	All lines in the group share the same contact line name (Cisco Unity Connection implements the hunt group). Example where Cisco Unity Connection is 10.93.248.36, Unity SIP port is 5060, contact line name is 3200: INVITE sip:3200@10.93.248.36:5060 SIP/2.0
Business Rules:	Pertinent only if TelephonyIntegrationMethodEnum = SIP.
Developer Notes:	Data validation is based on 'user' portion of user@server.com from RFC 3261.
Table/Column Mapping:	tbl_MediaPortGroup.SipContactLineName
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\!~*')&=+\$.;?%\]\]*\$
Validation - Description:	All alphabetical and digits 0-9 ASCII characters. Special characters hyphen, underscore, period, exclamation mark, tilde, asterisk, single quote, opening and closing parens, ampersand, equals, plus, dollar sign, comma, semicolon, question mark, backslash, and percent sign are allowed.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SipDoAuthenticate

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should authenticate with the remote endpoint.
Notes:	Values: 0: Do not authenticate with endpoint 1: Must authenticate with endpoint
Business Rules:	Applies only when TelephonyIntegrationMethodEnum=SIP.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SipDoAuthenticate
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SipRegisterWithProxyServer

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should register with a SIP proxy server.

Property Name	Value
Notes:	Values: 0: Do not register with a SIP proxy server 1: Must register with a SIP proxy server
Business Rules:	Applies only when TelephonyIntegrationMethodEnum=SIP.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SipRegisterWithProxyServer
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SipTransportProtocolEnum

Property Name	Value
Description:	The transport protocol Cisco Unity Connection should use for the SIP integration.
Notes:	FK to EnumSIPTransportProtocol.Enum Values: 10: UDP - Uniform Datagram Protocol. 11: TDP - Transport Control Protocol.
Business Rules:	Applies only when TelephonyIntegrationMethodEnum=SIP or PIMG. For PIMG, for now should not be displayed in SA or should be displayed disabled with default value (UDP). Once we have had a chance to qualify PIMG with TCP, we can allow editing of this field through the SA.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SipTransportProtocolEnum
Primary Key:	False
Allow Null:	True
Default Value:	10
Custom Type:	SIPTransportProtocol
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SkinnyDevicePrefix

Property Name	Value
Description:	The prefix Cisco Unity Connection uses to generate Skinny device name for ports belonging to this group.
Notes:	<p>Cisco Unified Communications Manager generates voice mail device names from a prefix supplied by the user. In Cisco CallManager 4.0 Administration, this prefix is called the "Cisco Voice Mail Server Name". Individual device names are of the form <prefix>-VI1, <prefix>-VI2, etc., where the "-VI" plus sequential number are added by Cisco Unified Communications Manager.</p> <p>This setting should specify the entire device name except for the sequential number at the end. For example, if the Cisco Voice Mail Server Name configured on Cisco Unified Communications Manager is "UnityVM", then device names will be "UnityVM-VI1", "UnityVM-VI2", etc. In this setting in Cisco Unity Connection you would specify "UnityVM-VI".</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.SkinnyDevicePrefix
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (48 characters)
Validation - Expression:	^[a-zA-Z0-9_\.]*\$
Validation - Description:	ASCII alphanumeric, period, hyphen and underscore.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	48 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TelephonyIntegrationMethodEnum

Property Name	Value
Description:	The method used by lines in this group to integrate with the switch.

Property Name	Value
Notes:	FK to TelephonyIntegrationMethodEnum.Enum. Values: 1: Skinny Client Control Protocol (SCCP) integration method. 2: Session Initiation Protocol (SIP) integration method. 3: Intel PBX IP Media Gateway (PIMG) integration method.
Business Rules:	Once a instance of this object has been created, this value can never be modified.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.TelephonyIntegrationMethodEnum
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	TelephonyIntegrationMethod
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WaitForCallInfoMs

Property Name	Value
Description:	Number of milliseconds to wait for call information (CallerID, CalledID, etc.) to arrive after answering the call.
Notes:	Typically used for PIMG integrations where the PBX sends call info to the PIMG (for instance, by inband DTMF) only after the call has been answered.
Business Rules:	
Developer Notes:	Added for CSCsd65984
Table/Column Mapping:	tbl_MediaPortGroup.WaitForCallInfoMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0

Property Name	Value
Validation - Maximum Value:	60000

5.108. vw_MediaPortGroup_PortCountOnVmsServer

Shows the number of telephony ports by port group on a VMS server.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroup object.	ObjectID
	PortCount	int (4 bytes)	Number of telephony ports by VmsServer and port group.	
	TelephonyIntegration-MethodEnum	smallint (2 bytes)	The method used by lines in this group to integrate with the switch.	TelephonyIn- tegration- Method
	VmsServerName	nvarchar (64 characters)	The name of the server.	
PK	VmsServerObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a VMSServer object.	ObjectID

Stored Procedures

vw_MediaPortGroup_PortCountOnVmsServer has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	The unique text name of this MediaPortGroup. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PortCount

r

Property Name	Value
Description:	Number of telephony ports by VmsServer and port group.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TelephonyIntegrationMethodEnum

Property Name	Value
Description:	The method used by lines in this group to integrate with the switch.
Notes:	FK to TelephonyIntegrationMethodEnum.Enum. Values: 1: Skinny Client Control Protocol (SCCP) integration method. 2: Session Initiation Protocol (SIP) integration method. 3: Intel PBX IP Media Gateway (PIMG) integration method.
Business Rules:	Once a instance of this object has been created, this value can never be modified.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroup.TelephonyIntegrationMethodEnum
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	TelephonyIntegrationMethod
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

VmsServerName

Property Name	Value
Description:	The name of the server.
Notes:	
Business Rules:	The server name must be unique within the VMS.
Developer Notes:	Data validation is based on DNS syntax rules as specified in RFC 1035 for a DNS domain name label.
Table/Column Mapping:	tbl_VMSServer.Name
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9\-\]*\$
Validation - Description:	ASCII characters only. All alphanumeric characters and hyphen.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VmsServerObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a VMSServer object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_VMSServer.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

5.109. vw_MediaPortGroupCodec

Simple view for tbl_MediaPortGroupCodec

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	MediaPortGroupObject-Id	char (36 characters)	The unique identifier of the MediaPortGroup object that is mapped to the specified RtpCodecDef.	ObjectID
PK	ObjectId	char (36 characters)	Primary key	ObjectID
	Preference	int (4 bytes)	Preference ranking for this codec relative to other codecs supported for the port group. Lowest value of Preference is the most preferred.	
	PreferredPacketSizeMs	int (4 bytes)	Specifies the default packet size (in milliseconds) when negotiating this codec for SIP. The setting is used in the following situations: 1) No incoming SDP ptime attribute in incoming SDP offer. 2) Cisco Unity Connection initiated SDP offer. If the other party in the SIP negotiation provides a ptime attribute in the SDP before Cisco Unity Connection has a chance to do it, Cisco Unity Connection honors the request and this setting does not come into play.	RTPPacket-SizeMs
	RtpCodecDefDisplay-Name	nvarchar (64 characters)	Codec name displayed to end user	DisplayName
	RtpCodecDefObjectId	char (36 characters)	The unique identifier of the RtpCodecDefinition object that is mapped to the specified MediaPortGroup.	ObjectID

Stored Procedures

Name	Description
csp_MediaPortGroupCodecCreate	Create a row in tbl_MediaPortGroupCodec
csp_MediaPortGroupCodecDelete	Delete a row in tbl_MediaPortGroupCodec
csp_MediaPortGroupCodecModify	Modify a row in tbl_MediaPortGroupCodec

Column Properties

MediaPortGroupObjectId

Property Name	Value
Description:	The unique identifier of the MediaPortGroup object that is mapped to the specified RtpCodecDef.
Notes:	Foreign key to the port group
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupCodec.MediaPortGroupObjectId

5.110. vw_MediaPortGroupIPPort

A simple view of tbl_MediaPortGroupIPPort.

IP ports on each Cisco Unity Connection server that are reserved for a specific purpose - assigned to a MediaPortGroup.

Additional Information

For telephony configuration, this table will record the IP ports in use for SIP (SIP and PIMG integrations).

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	IpPort	int (4 bytes)	The IP port number.	
	IpPortPurposeEnum	smallint (2 bytes)	The purpose for which this IP port is used.	IPPortPurpose
	MediaPortGroupObject-Id	char (36 characters)	The unique identifier of the MediaPortGroup object that will open a socket using this IP port.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroupIPPort object.	ObjectID
	VmsServerObjectId	char (36 characters)	The unique identifier of the VMSServer object on which this IP port is located.	ObjectID

Stored Procedures

Name	Description
csp_MediaPortGroupIPPortCreate	Creates a new MediaPortGroupIPPort object by inserting a new row into tbl_MediaPortGroupIPPort.
csp_MediaPortGroupIPPortDelete	Deletes a MediaPortGroupIPPort object from tbl_MediaPortGroupIPPort as specified by the @ObjectId parameter.
csp_MediaPortGroupIPPortModify	Updates the attributes of a MediaPortGroupIPPort object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaPortGroupIPPort object that is updated.

Column Properties

IpPort

Property Name	Value
Description:	The IP port number.
Notes:	
Business Rules:	Range: 0-65535. When an instance of a MediaPortGroupIPPort object is created or the value of IPPort is modified, the value should fall within the range(s) specified in IPPortReservation for the same Purpose.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupIPPort.IpPort
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	65535

IpPortPurposeEnum

Property Name	Value
Description:	The purpose for which this IP port is used.
Notes:	Values: 505: Incoming SIP call control to establish media session 506: Outgoing SIP UDP 507: RTP and RTCP 508: All SMTP traffic
Business Rules:	
Developer Notes:	In Kubrick 1, used only to store SIP port assignments.
Table/Column Mapping:	tbl_MediaPortGroupIPPort.IpPortPurposeEnum
Primary Key:	False
Allow Null:	False
Default Value:	500
Custom Type:	IPPortPurpose
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupObjectId

Property Name	Value
Description:	The unique identifier of the MediaPortGroup object that will open a socket using this IP port.
Notes:	FK to MediaPortGroup.ObjectId
Business Rules:	Unique: [MediaPortGroupObjectId, IPPortPurpose, VMSServerObjectId] - For a given port group, only one IP port is needed on each VMS server for a specific purpose. For instance, for a SIP port group, assign max one SIP IP port on each VMSServer.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupIPPort.MediaPortGroupObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroupIPPort object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupIPPort.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Property Name	Value
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VmsServerObjectId

Property Name	Value
Description:	The unique identifier of the VMSServer object on which this IP port is located.
Notes:	FK to VMSServer.ObjectId
Business Rules:	Unique: [VMSServerObjectId,IPPort] - A port number cannot be assigned more than once on each VMS server.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupIPPort.VmsServerObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.111. vw_MediaPortGroupTemplate

A simple view for tbl_MediaPortGroupTemplate.

Contains the default values for attributes of a MediaPortGroup. The MediaGroupPortTemplate is used to create new media port groups.

Additional Information

Each MediaPortGroupTemplate is designed for a specific model/manufacture of switch. The model is stored in the template itself. In the Cisco Unity Connection Administration, when an administrator tries to create a MediaPortGroup, the administrative interface looks up the model/manufacture of the MediaSwitch to which the MediaPortGroup will belong and displays a list containing only templates matching that model/manufacture. Once a selection is made, the administrative interface copies the defaults specified in the template into the new MediaPortGroup object.

Columns with names beginning with "Copy_" are values that are copied into the new row in MediaPortGroup. For instance, MediaPortGroupTemplate.Copy_DisplayName is the value of DisplayName in the new MediaPortGroup.

All of the Copy_ columns allow NULLs. If a column is NULL, the corresponding column in MediaPortGroup will assume the default value specified in MediaPortGroup. Thus the Copy_ columns in this table basically override the default values in the MediaPortGroup table.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Copy_CCMDAutoFailback	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should automatically re-register (i.e. failback) with a higher-precedence CCM server if one becomes available. This is pertinent if a Cisco Unity Connection Skinny device is currently registered to a CCM server that is not the primary server.	Bool
	Copy_DelayBeforeOpeningMs	smallint (2 bytes)	The delay (in milliseconds) after a call is connected before playing the opening greeting.	
	Copy_DTMFDialInterDigitDelayMs	int (4 bytes)	The amount of time (in milliseconds) between DTMF digits when sending DTMF to the PBX.	
	Copy_EnableAGC	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should apply software-based gain control when recording messages.	Bool
	Copy_EnableMWI	smallint (2 bytes)	A flag indicating whether ports in this group can transmit message waiting indicator (MWI) on/off messages to the switch via inband integration method (through use of DTMF).	Bool
	Copy_MWIMaxConcurrentRequests	smallint (2 bytes)	The maximum number of MWI requests that can be in progress at any instant.	
	Copy_MWIMinRequestIntervalMs	int (4 bytes)	The minimum amount of time (in milliseconds) between sending MWI on/off requests to the switch.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	Copy_MWIOffCode	nvarchar (128 characters)	The access code that Cisco Unity Connection uses to deactivate (extinguish) a message waiting indicator (MWI).	MwiCode
	Copy_MWIONCode	nvarchar (128 characters)	The access code that Cisco Unity Connection uses to activate (light) a message waiting indicator (MWI).	MwiCode
	Copy_MWIReqPortSpecific	smallint (2 bytes)	A flag indicating whether MWI requests require a MediaPort.	Bool
	Copy_MWIRetryCountOnSuccess	smallint (2 bytes)	The number of times Cisco Unity Connection should repeat activating/deactivating an MWI upon success.	
	Copy_MWIRetryIntervalOnSuccessMs	smallint (2 bytes)	The minimum time interval (in milliseconds) between repeated transmissions of MWI on/off, see Copy_MWIRetryIntervalCountOnSuccess.	
	Copy_OutgoingGuardTimeMs	int (4 bytes)	The amount of time (in milliseconds) a port in this group must be on-hook before the Cisco Unity Connection will allow an outgoing call on that port.	
	Copy_OutgoingPostDialDelayMs	int (4 bytes)	The delay (in milliseconds) after dialing an outgoing call.	
	Copy_OutgoingPreDialDelayMs	int (4 bytes)	The delay (in milliseconds) before dialing.	
	Copy_PortNumMax	int (4 bytes)	Specifies the maximum allowable value for tbl_MediaPort.PortNumInGroup for rows in that table that belong to this port group. Value of zero means that the number of ports is unlimited, subject to any other restrictions that may apply.	
	Copy_SIPDoAuthenticate	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should authenticate with the remote endpoint.	Bool
	Copy_SIPRegisterWithProxyServer	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should register with a SIP proxy server.	Bool
	Copy_SIPTransportProtocolEnum	smallint (2 bytes)	The transport protocol Cisco Unity Connection should use for the SIP integration.	SIPTransport-Protocol
	Copy_TelephonyIntegrationMethodEnum	smallint (2 bytes)	The method used by lines in this group to integrate with the switch.	TelephonyIntegration-Method
	Copy_WaitForCallInfos	int (4 bytes)	Number of milliseconds to wait for call information (CallerID, CalledID, etc.) to arrive after answering the call.	
	MediaSwitchModelObjectId	char (36 characters)	The unique identifier of the MediaSwitchModel object to which this template applies.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroupTemplate object.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	TemplateDescriptionDefault	lvarchar (256 characters)	A description of the MediaPortGroupTemplate to aid the user in the selection of a template for the purpose of creating a new MediaPortGroup. Information such as Cisco Unity Connection system requirements and PBX requirements are contained in this column.	
	TemplateDescriptionLoc	lvarchar (256 characters)	The short name of template description used to retrieve the localized version of the template description from tbl_LocalizedText.	
	TemplateNameDefault	lvarchar (256 characters)	The name/title of the template.	
	TemplateNameLoc	lvarchar (256 characters)	The short name of template name used to retrieve the localized version of the template name from tbl_LocalizedText.	

Stored Procedures

Name	Description
csp_MediaPortGroupTemplateCreate	Creates a new MediaPortGroupTemplate object by inserting a new row into tbl_MediaPortGroupTemplate.
csp_MediaPortGroupTemplateDelete	Deletes a MediaPortGroupTemplate object from tbl_MediaPortGroupTemplate as specified by the @ObjectId parameter.
csp_MediaPortGroupTemplateModify	Updates the attributes of a MediaPortGroupTemplate object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaPortGroupTemplate object that is updated.

Column Properties

Copy_CCMDDoAutoFailback

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should automatically re-register (i.e. failback) with a higher-precedence CCM server if one becomes available. This is pertinent if a Cisco Unity Connection Skinny device is currently registered to a CCM server that is not the primary server.
Notes:	Values: 0: Do not failback 1: Failback
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_CCMDDoAutoFailback
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_DelayBeforeOpeningMs

Property Name	Value
Description:	The delay (in milliseconds) after a call is connected before playing the opening greeting.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] DelayBeforeOpening.
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_DelayBeforeOpeningMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

Copy_DTMFDialInterDigitDelayMs

Property Name	Value
Description:	The amount of time (in milliseconds) between DTMF digits when sending DTMF to the PBX.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_DTMFDialInterDigitDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	500

Copy_EnableAGC

Property Name	Value
Description:	A flag indicting whether Cisco Unity Connection should apply software-based gain control when recording messages.
Notes:	Gain control is performed in software on the Cisco Unity Connection host. Values: 0: Do not perform software-based gain control 1: Software-based gain control is performed on Cisco Unity Connection
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_EnableAGC
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_EnableMWI

Property Name	Value
Description:	A flag indicating whether ports in this group can transmit message waiting indicator (MWI) on/off messages to the switch via inband integration method (through use of DTMF).
Notes:	Values: 0: Cannot transmit MWI using inband integration method 1: Can transmit MWI using inband integration method
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_EnableMWI
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_MWIMaxConcurrentRequests

Property Name	Value
Description:	The maximum number of MWI requests that can be in progress at any instant.
Notes:	Used for "MWI throttling" feature. A value of 0 indicates that this limitation is not in effect.
Business Rules:	Applies to ALL integrations.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIMaxConcurrentRequests
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0

Property Name	Value
Validation - Maximum Value:	250

Copy_MWIMinRequestIntervalMs

Property Name	Value
Description:	The minimum amount of time (in milliseconds) between sending MWI on/off requests to the switch.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] MinimumMWIRequestInterval. This is used for MWI throttling.
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIMinRequestIntervalMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	5000

Copy_MWIOffCode

Property Name	Value
Description:	The access code that Cisco Unity Connection uses to deactivate (extinguish) a message waiting indicator (MWI).
Notes:	Dialogic: feature access code programmed on the PBX. Skinny/CCM: MWI DN programmed on the cluster.
Business Rules:	Does not apply to SIP or PIMG integrations (Unity ignores value). For other integration types, pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIOffCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	MwiCode

Property Name	Value
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[0-9A-Da-dPpTtXx#*,]*\$
Validation - Description:	Standard dialstring characters: 0-9, A-D, #, *, comma (pause) and X (primary DTMF ID for subscriber), T (touchtone dialing) and P (pulse dialing).
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_MWIONCode

Property Name	Value
Description:	The access code that Cisco Unity Connection uses to activate (light) a message waiting indicator (MWI).
Notes:	Dialogic: feature access code programmed on the PBX. Skinny/CCM: MWI DN programmed on the cluster.
Business Rules:	Does not apply to SIP or PIMG integrations (Unity ignores value). For other integration types, pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIONCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	MwiCode
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[0-9A-Da-dPpTtXx#*,]*\$
Validation - Description:	Standard dialstring characters: 0-9, A-D, #, *, comma (pause) and X (primary DTMF ID for subscriber), T (touchtone dialing) and P (pulse dialing).
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_MWIReqPortSpecific

Property Name	Value
Description:	A flag indicating whether MWI requests require a MediaPort.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIReqPortSpecific
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_MWIRetryCountOnSuccess

Property Name	Value
Description:	The number of times Cisco Unity Connection should repeat activating/deactivating an MWI upon success.
Notes:	
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIRetryCountOnSuccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10

Copy_MWIRetryIntervalOnSuccessMs

Property Name	Value
Description:	The minimum time interval (in milliseconds) between repeated transmissions of MWI on/off, see Copy_MWIRetryIntervalCountOnSuccess.
Notes:	
Business Rules:	Pertinent only if EnableMWI = TRUE.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_MWIRetryIntervalOnSuccessMs
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

Copy_OutgoingGuardTimeMs

Property Name	Value
Description:	The amount of time (in milliseconds) a port in this group must be on-hook before the Cisco Unity Connection will allow an outgoing call on that port.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingGuardTime.
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_OutgoingGuardTimeMs
Primary Key:	False
Allow Null:	False
Default Value:	2500
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10000

Copy_OutgoingPostDialDelayMs

Property Name	Value
Description:	The delay (in milliseconds) after dialing an outgoing call.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingPostDialDelayMs.
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_OutgoingPostDialDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

Copy_OutgoingPreDialDelayMs

Property Name	Value
Description:	The delay (in milliseconds) before dialing.
Notes:	This is the default value for the corresponding column in MediaPortGroup.
Business Rules:	Applies to ALL integrations.
Developer Notes:	In Unity 4.0 switch.ini files: [Configuration] OutgoingPreDialDelayMs.
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_OutgoingPreDialDelayMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	3000

Copy_PortNumMax

Property Name	Value
Description:	Specifies the maximum allowable value for tbl_MediaPort.PortNumInGroup for rows in that table that belong to this port group. Value of zero means that the number of ports is unlimited, subject to any other restrictions that may apply.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_PortNumMax
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	256

Copy_SIPDoAuthenticate

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should authenticate with the remote endpoint.
Notes:	Values: 0: Do not authenticate with endpoint 1: Must authenticate with endpoint
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_SIPDoAuthenticate
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_SIPRegisterWithProxyServer

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should register with a SIP proxy server.
Notes:	Values: 0: Do not register with a SIP proxy server 1: Must register with a SIP proxy server
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_SIPRegisterWithProxyServer
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_SIPTransportProtocolEnum

Property Name	Value
Description:	The transport protocol Cisco Unity Connection should use for the SIP integration.
Notes:	FK to EnumSIPTransportProtocol.Enum. Values: 10: UDP - Uniform Datagram Protocol. 11: TDP - Transport Control Protocol.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_SIPTransportProtocolEnum
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	10
Custom Type:	SIPTransportProtocol
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_TelephonyIntegrationMethodEnum

Property Name	Value
Description:	The method used by lines in this group to integrate with the switch.
Notes:	FK to TelephonyIntegrationMethodEnum.Enum. Values: 1: Skinny Client Control Protocol (SCCP) integration method. 2: Session Initiation Protocol (SIP) integration method. 3: Intel PBX IP Media Gateway (PIMG) integration method.
Business Rules:	Once a instance of this object has been created, this value can never be modified.
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_TelephonyIntegrationMethodEnum
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	TelephonyIntegrationMethod
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Copy_WaitForCallInfoMs

Property Name	Value
Description:	Number of milliseconds to wait for call information (CallerID, CalledID, etc.) to arrive after answering the call.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.Copy_WaitForCallInfoMs
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	60000

MediaSwitchModelObjectID

Property Name	Value
Description:	The unique identifier of the MediaSwitchModel object to which this template applies.
Notes:	Foreign key to MediaSwitchModel.Moniker This value is used by clients such as Cisco Unity Connection Administration that allow the user to create port groups. Client should allow creation only from templates that match the model of the MediaSwitch to which the new port group belongs.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.MediaSwitchModelObjectID
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaPortGroupTemplate object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TemplateDescriptionDefault

Property Name	Value
Description:	A description of the MediaPortGroupTemplate to aid the user in the selection of a template for the purpose of creating a new MediaPortGroup. Information such as Cisco Unity Connection system requirements and PBX requirements are contained in this column.
Notes:	Displayed only if language-specific translation of TemplateDescriptionLoc cannot be retrieved from tbl_LocalizedText.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.TemplateDescriptionDefault
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	

Property Name	Value
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII or Unicode)
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TemplateDescriptionLoc

Property Name	Value
Description:	The short name of template description used to retrieve the localized version of the template description from tbl_LocalizedText.
Notes:	References tbl_LocalizedText.LocalizationKey.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.TemplateDescriptionLoc
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TemplateNameDefault

Property Name	Value
Description:	The name/title of the template.
Notes:	Displayed only if language-specific translation of TemplateNameLoc cannot be retrieved from tbl_LocalizedText.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.TemplateNameDefault

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TemplateNameLoc

Property Name	Value
Description:	The short name of template name used to retrieve the localized version of the template name from tbl_LocalizedText.
Notes:	References tbl_LocalizedText.LocalizationKey.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaPortGroupTemplate.TemplateNameLoc
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.112. vw_MediaRemoteService

A simple view for tbl_MediaRemoteService.

An IP-based endpoint or service (e.g., Cisco Call Manager, SIP Proxy server) with which Cisco Unity Connection can communicate.

Additional Information

The information contained in this table is different depending on the integration's integration method.

Example: For a CCM cluster with three CCM servers and one TFTP server, the MediaRemoteService table would contain four rows: three separate rows - one for each CCM, and one row for a CCMTFTP.

MediaRemoteServiceEnum is the discriminator that determines which of the two columns must be non-NULL:

- * CCMAXL: MediaSwitchObjectId IS NOT NULL, MediaPortGroupObjectID = NULL.
- * CCM, CCMTFTP, PIMG and SIPProxy: MediaSwitchObjectId = NULL, MediaPortGroupObjectID IS NOT NULL.
- * ASRMediaServer and TTSMediaServer: MediaSwitchObjectId = NULL, MediaPortGroupObjectID = NULL.

Business Rules

- * CCMAXL: MediaSwitchObjectId IS NOT NULL, MediaPortGroupObjectID = NULL.
- * CCM, CCMTFTP, PIMG and SIPProxy: MediaSwitchObjectId = NULL, MediaPortGroupObjectID IS NOT NULL.
- * ASRMediaServer and TTSMediaServer: MediaSwitchObjectId = NULL, MediaPortGroupObjectID = NULL.

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The name of the service. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	HostOrIPAddress	lvarchar (256 characters)	The DNS name or IP address of the computer hosting the remote service .	
	MediaPortGroupObject-Id	char (36 characters)	The unique identifier of the MediaPortGroup object to which this row corresponds.	ObjectID
	MediaRemoteServiceEnum	smallint (2 bytes)	The type of IP service.	MediaRemoteService
	MediaServerName	nvarchar (128 characters)	The preferred name of the media server, if applicable.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to which this row corresponds.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaRemoteService object.	ObjectID
	Port	int (4 bytes)	The IP port at which the service is found.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	Precedence	int (4 bytes)	A ranking of priority for rows in this table with identical [MediaSwitchObject, MediaPortGroupObjectId, MediaRemoteServiceEnum] in which connection is attempted to them, that is, as primary, secondary, etc.	
	SkinnyStateMachineEnum	smallint (2 bytes)	A flag indicating whether this MediaPortGroup is integrated with Cisco Unified Communications Manager or Cisco CallManager Express. This is used to switch on a special state engine in the Skinny TSP for Cisco CallManager Express.	SkinnyStateMachine
	TlsPort	int (4 bytes)	The IP port at which the service is found. Cisco Unity Connection must negotiate a TLS session when using this port.	

Stored Procedures

Name	Description
csp_MediaRemoteServiceCreate	Creates a new MediaRemoteService object by inserting a new row into tbl_MediaRemoteService.
csp_MediaRemoteServiceDelete	Deletes a MediaRemoteService object from tbl_MediaRemoteService as specified by the @ObjectId parameter.
csp_MediaRemoteServiceModify	Updates the attributes of a MediaRemoteService object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaRemoteService object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The name of the service. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

HostOrIPAddress

Property Name	Value
Description:	The DNS name or IP address of the computer hosting the remote service .
Notes:	IPv6 addresses not permitted yet.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.HostOrIPAddress
Primary Key:	False
Allow Null:	False
Default Value:	127.0.0.1
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortGroupId

Property Name	Value
Description:	The unique identifier of the MediaPortGroup object to which this row corresponds.
Notes:	MediaRemoteServiceEnum is the discriminator that determines whether the two columns MediaSwitchObjectId and MediaPortGroupId must be non-NULL or NULL.

Property Name	Value
Business Rules:	* CCMAXL: MediaSwitchObjectId IS NOT NULL, MediaPortGroupObjectID = NULL. * CCM, CCMTFTP, PIMG and SIPProxy: MediaSwitchObjectId = NULL, MediaPortGroupObjectID IS NOT NULL. * ASRMediaServer and TTSMediaServer: MediaSwitchObjectId = NULL, MediaPortGroupObjectID = NULL.
Developer Notes:	FK to MediaPortGroup.ObjectId
Table/Column Mapping:	tbl_MediaRemoteService.MediaPortGroupObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaRemoteServiceEnum

Property Name	Value
Description:	The type of IP service.
Notes:	MediaRemoteServiceEnum is the discriminator that determines whether the two columns MediaSwitchObjectId and MediaPortGroupObjectId must be non-NULL or NULL. Values: 100: Cisco Unified Communications Manager server. 101: Cisco Unified Communications Manager Trivial File Transfer Protocol service. 102: SIP proxy server. 103: Cisco Unified Communications Manager AXL service 104: PIMG 105: Automatic Speech Recognition media server. 106: Text-To-Speech media server.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.MediaRemoteServiceEnum
Primary Key:	False
Allow Null:	False
Default Value:	100
Custom Type:	MediaRemoteService
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaServerName

Property Name	Value
Description:	The preferred name of the media server, if applicable.
Notes:	Example values. For ASR, name="Recognizer", for TTS, name="synthesizer."
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.MediaServerName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to which this row corresponds.
Notes:	MediaRemoteServiceEnum is the discriminator that determines whether the two columns MediaSwitchObjectId and MediaPortGroupObjectId must be non-NULL or NULL.
Business Rules:	<ul style="list-style-type: none"> * CCMAXL: MediaSwitchObjectId IS NOT NULL, MediaPortGroupObjectId = NULL. * CCM, CCMTFTP, PIMG and SIPProxy: MediaSwitchObjectId = NULL, MediaPortGroupObjectId IS NOT NULL. * ASRMediaServer and TTSMediaServer: MediaSwitchObjectId = NULL, MediaPortGroupObjectId = NULL.
Developer Notes:	FK to MediaSwitch.ObjectId

Property Name	Value
Table/Column Mapping:	tbl_MediaRemoteService.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaRemoteService object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Port

Property Name	Value
Description:	The IP port at which the service is found.

Property Name	Value
Notes:	
Business Rules:	Range: 0-65535
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.Port
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	65535

Precedence

Property Name	Value
Description:	A ranking of priority for rows in this table with identical [MediaSwitchObject, MediaPortGroupObjectId, MediaRemoteServiceEnum] in which connection is attempted to them, that is, as primary, secondary, etc.
Notes:	Rows with identical values of MediaRemoteServiceEnum, MediaSwitchObjectId, MediaPortGroupObjectId are considered to be redundant providers of the same service. Within such a group, the row with the lowest Precedence is the primary server, row with the next higher Precedence is the secondary server, etc. Gaps in the numbering are allowed. If duplicates of Precedence exist within a group, the ordering is undefined and Cisco Unity Connection will arbitrarily impose an ordering.
Business Rules:	GTE zero.
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.Precedence
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0

Property Name	Value
Validation - Maximum Value:	65535

SkinnyStateMachineEnum

Property Name	Value
Description:	A flag indicating whether this MediaPortGroup is integrated with Cisco Unified Communications Manager or Cisco CallManager Express. This is used to switch on a special state engine in the Skinny TSP for Cisco CallManager Express.
Notes:	Values: 10: Cisco Unified Communications Manager 20: Cisco CallManager Express
Business Rules:	Pertinent only when MediaRemoteServiceEnum = CCM.
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.SkinnyStateMachineEnum
Primary Key:	False
Allow Null:	False
Default Value:	10
Custom Type:	SkinnyStateMachine
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TlsPort

Property Name	Value
Description:	The IP port at which the service is found. Cisco Unity Connection must negotiate a TLS session when using this port.
Notes:	
Business Rules:	Range: 0-65535
Developer Notes:	
Table/Column Mapping:	tbl_MediaRemoteService.TlsPort
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	

Property Name	Value
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	65535

5.113. vw_MediaSwitch

A view for tbl_MediaSwitch plus:

- * The objectid and display name of the parent MediaSwitchModel
- * The objectid and display name of the parent MediaSwitchManufacturer
- * The total number of ports belonging to the MediaSwitch

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallLoopDTMF	nvarchar (16 characters)	The name of the 4th Column DTMF tone used for Reject Forward Notification and Supervised Call Loop Detection.	DtmfColumn
	CallLoopForwardNotificationDetect	smallint (2 bytes)	A flag indicating whether Reject Forwarded Notification is enabled.	Bool
	CallLoopGuardTimeMs	int (4 bytes)	The amount of time (in milliseconds) i.e. "guard time" used for Rejecting Forwarded Notifications and Supervised Transfer Call Loop Detection.	
	CallLoopSupervisedTransferDetect	smallint (2 bytes)	A flag indicating whether Supervised Transfer Call Loop Detection is enabled.	Bool
	CcmAXLPassword	varchar (254 characters)	The password (encrypted) for the CcmAXLUser used to connect to a AXL Web service on a Cisco Call Manager cluster.	
	CcmAXLUser	nvarchar (128 characters)	The user name used to connect to AXL Web service on a Cisco Call Manager cluster.	
	CcmCtiPassword	varchar (254 characters)	The password (encrypted) for the CcmCtiUser.	
	CcmCtiUser	nvarchar (128 characters)	The user name for a Call Manager user that is assigned CTI access to one or more CCM devices.	
	CcmVersion	nvarchar (16 characters)	The product version of the Cisco Unified Communications Manager switch.	
	DefaultTRaPSwitch	smallint (2 bytes)	Use this as default TRaP switch for administrators?	Bool
	DisplayName	nvarchar (64 characters)	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	EnablePhoneApplications	smallint (2 bytes)	A flag indicating whether IP phone applications are enabled for this switch (e.g., integration).	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	MediaSwitchManufacturerDisplayName	nvarchar (64 characters)	The display name of the parent MediaSwitchManufacturer.	
	MediaSwitchManufacturerObjectId	char (36 characters)	The unique identifier of the parent MediaSwitchManufacturer.	ObjectID
	MediaSwitchModelDisplayName	nvarchar (64 characters)	The name of the parent MediaSwitchModel.	
	MediaSwitchModelObjectId	char (36 characters)	The unique identifier of the MediaSwitchModel object for this telephone switch/network.	ObjectID
	MwiAlwaysUpdate	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will always send a "set MWI" message to the switch whenever the mailbox contents change, even if the Cisco Unity Connection database record indicates the MWI is already in the correct state.	Bool
	MwiForceOff	smallint (2 bytes)	A flag that indicates whether all User MWI devices falling on this phone system should be unconditionally off.	Bool
	MwiPortMemory	smallint (2 bytes)	A flag indicating whether the switch requires that Cisco Unity Connection send MWI "off" requests to the same PBX port as the MWI "on" requests.	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaSwitch object.	ObjectID
	PortCount	int (4 bytes)	The total number of ports belonging to the switch.	

Stored Procedures

Name	Description
csp_MediaSwitchCreate	Creates a new MediaSwitch object by inserting a new row into tbl_MediaSwitch.
csp_MediaSwitchDelete	Deletes a MediaSwitch object from tbl_MediaSwitch as specified by the @ObjectId parameter.
csp_MediaSwitchModify	Updates the attributes of a MediaSwitch object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaSwitch object that is updated.

Column Properties

CallLoopDTMF

Property Name	Value
Description:	The name of the 4th Column DTMF tone used for Reject Forward Notification and Supervised Call Loop Detection.
Notes:	Values: A: DTMF 'A' 4th column. (1633Hz/697Hz tone) B: DTMF 'B' 4th column. (1633Hz/770Hz tone) C: DTMF 'C' 4th column. (1633Hz/852Hz tone) D: DTMF 'D' 4th column. (1633Hz/941Hz tone)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CallLoopDTMF
Primary Key:	False
Allow Null:	False
Default Value:	A
Custom Type:	DtmfColumn

CallLoopSupervisedTransferDetect

Property Name	Value
Description:	A flag indicating whether Supervised Transfer Call Loop Detection is enabled.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CallLoopSupervisedTransferDetect
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmAXLPassword

Property Name	Value
Description:	The password (encrypted) for the CcmAXLUser used to connect to a AXL Web service on a Cisco Call Manager cluster.
Notes:	In the Call Manager database, this is the ApplicationUser.Password attribute.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CcmAXLPassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmAXLUser

Property Name	Value
Description:	The user name used to connect to AXL Web service on a Cisco Call Manager cluster.
Notes:	In the Call Manager database, this is the ApplicationUser.Name attribute.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CcmAXLUser
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	

Property Name	Value
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmCtiPassword

Property Name	Value
Description:	The password (encrypted) for the CcmCtiUser.
Notes:	In the Call Manager database, this is the EndUser.Password attribute.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CcmCtiPassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmCtiUser

Property Name	Value
Description:	The user name for a Call Manager user that is assigned CTI access to one or more CCM devices.
Notes:	In the Call Manager database, this is the EndUser.UserId attribute.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CcmCtiUser
Primary Key:	False

Property Name	Value
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmVersion

Property Name	Value
Description:	The product version of the Cisco Unified Communications Manager switch.
Notes:	This information is used to create individual Cisco Unity Connection voice mailboxes from the CCMAAdmin User and Directory Number (DN) pages. (AKA "Concerto")
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.CcmVersion
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (16 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultTRaPSwitch

Property Name	Value
Description:	Use this as default TRaP switch for administrators?
Notes:	Administrators that are not subscribers do not have a switch association so this specifies the switch to use for TRaP (telephone record and playback).

Property Name	Value
Business Rules:	Only one switch may have this value set to 1 (true).
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.DefaultTRaPSwitch
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name (e.g., "Unified Communications Manager Cluster - Seattle") of the media switch to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EnablePhoneApplications

Property Name	Value
Description:	A flag indicating whether IP phone applications are enabled for this switch (e.g., integration).
Notes:	Phone applications present and gather information via the display on IP phones. The Visual Message Locator feature is one example of a phone application.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.EnablePhoneApplications
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchManufacturerDisplayName

Property Name	Value
Description:	The display name of the parent MediaSwitchManufacturer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchManufacturerObjectId

Property Name	Value
Description:	The unique identifier of the parent MediaSwitchManufacturer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchModelDisplayName

Property Name	Value
Description:	The name of the parent MediaSwitchModel.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchModelObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitchModel object for this telephone switch/network.
Notes:	Foreign key to tbl_MediaSwitchModel.
Business Rules:	
Developer Notes:	<p>Information in this column is mainly for troubleshooting. It should be filled in when the row is inserted with the MediaPortGroupTemplate.MediaSwitchModelObjectId of the template from which the row was created.</p> <p>Conceptually, this is a FK to MediaSwitchModel.ObjectId. But to allow for deletion of models over time, the relationship is not enforced. If in future releases of Cisco Unity Connection the model with this moniker doesn't exist, it's no big deal.</p>
Table/Column Mapping:	tbl_MediaSwitch.MediaSwitchModelObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiAlwaysUpdate

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will always send a "set MWI" message to the switch whenever the mailbox contents change, even if the Cisco Unity Connection database record indicates the MWI is already in the correct state.
Notes:	<p>Values:</p> <p>0: Do not send a "set MWI" message to the switch based solely on mailbox content changing</p> <p>1: Always send a "set MWI" message to the switch when mailbox contents change</p>
Business Rules:	
Developer Notes:	In Cisco Unity Connection 4.x this was named "UpdateDisplay."
Table/Column Mapping:	tbl_MediaSwitch.MwiAlwaysUpdate
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiForceOff

Property Name	Value
Description:	A flag that indicates whether all User MWI devices falling on this phone system should be unconditionally off.
Notes:	<p>Values:</p> <p>0 (FALSE, default): The state of User MWI devices/lamps falling on this phone system should reflect the state of the corresponding mailbox:</p> <ul style="list-style-type: none"> - If there are unread messages in the mailbox, then the lamp should be on. - If there are no unread messages in the mailbox, the lamp should be off. <p>1 (TRUE): All MWI devices/lamps falling on this phone system should be off regardless of the state of corresponding mailbox.</p> <p>Changing this setting causes Cisco Unity Connection to switch MWI devices on or off to match the new setting.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.MwiForceOff
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiPortMemory

Property Name	Value
Description:	A flag indicating whether the switch requires that Cisco Unity Connection send MWI "off" requests to the same PBX port as the MWI "on" requests.
Notes:	Values: 0: Not required to send MWI "off" requests to the same PBX port as MWI "on" requests 1: Must send MWI "off" requests to the same PBX port as the MWI "on" requests
Business Rules:	Typically used only for PIMG integrations.
Developer Notes:	In Cisco Unity Connection 4.x this was named "PortMemory."
Table/Column Mapping:	tbl_MediaSwitch.MwiPortMemory
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a MediaSwitch object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PortCount

Property Name	Value
Description:	The total number of ports belonging to the switch.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.114. vw_MediaSwitchManufacturer

A simple view for tbl_MediaSwitchManufacturer.

A telephone switch manufacturer such as "Cisco Systems" or "Ericsson."

Additional Information

This table contains the static data for a switch manufacturer. In general, the contents of this table are defined by Cisco Systems matching the switch manufacturer/model combinations for the valid and qualified integrations. This data is inserted into the table during the Cisco Unity Connection setup process. This data should never be modified by the user. In some cases however, it may be necessary for a user or third-party to add a manufacturer to this table. This extensibility can be used, for instance, if someone is testing/qualifying a new PBX. See IsUserDefined column for more information.

Business Rules

- * Cisco Unity Connection setup is not permitted to modify or delete a switch manufacturer that is user-defined.
- * Cisco Unity Connection setup may modify or delete a switch manufacturer that is not user-defined.
- * A user may not modify or delete a switch manufacturer that is not user-defined.

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The preferred text name of the switch manufacturer to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique identifier for a MediaSwitchManufacturer object.	ObjectID

Stored Procedures

Name	Description
csp_MediaSwitchManufacturerCreate	Creates a new MediaSwitchManufacturer object by inserting a new row into tbl_MediaSwitchManufacturer.
csp_MediaSwitchManufacturerDelete	Deletes a MediaSwitchManufacturer object from tbl_MediaSwitchManufacturer as specified by the @ObjectId parameter.
csp_MediaSwitchManufacturerModify	Updates the attributes of a MediaSwitchManufacturer object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaSwitchManufacturer object that is updated.
csp_MediaSwitchManufacturerSet	Creates a new MediaSwitchManufacturer object or updates the attributes of an existing MediaSwitchManufacturer object in tbl_MediaSwitchManufacturer.

Column Properties

DisplayName

Property Name	Value
Description:	The preferred text name of the switch manufacturer to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitchManufacturer.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique identifier for a MediaSwitchManufacturer object.
Notes:	Cisco Unity Connection must be able to locate a specific manufacturer in this table on any installation of Cisco Unity Connection, so a system-generated uniqueidentifier (GUID) will not work for this table. Therefore, this column is not automatically generated. Rather it is explicitly assigned by the author.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitchManufacturer.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Validation - Maximum Value:	

5.115. vw_MediaSwitchModel

A simple view for tbl_MediaSwitchModel.
A telephone switch model.

Additional Information

This table contains the static data for each telephone switch model. In general, the contents of this table are defined by Cisco Systems matching the switch manufacturer/model combinations for the valid and qualified integrations. This data is inserted into the table during the Cisco Unity Connection setup process. This data should never be modified by the user. In some cases however, it may be necessary for a user or third-party to add a switch model to this table. This extensibility can be used, for instance, if someone is testing/qualifying a new PBX. See IsUserDefined column for more information.

Business Rules

- * Cisco Unity Connection setup is not permitted to modify or delete a switch model that is user-defined.
- * Cisco Unity Connection setup may modify or delete a switch model that is not user-defined.
- * A user may not modify or delete a switch model that is not user-defined.

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DefaultMediaSwitchDisplayName	nvarchar (40 characters)	The default value for the display name of a media switch (tbl_MediaSwitch.DisplayName) when a MediaSwitch object of this model is created.	
	DisplayName	nvarchar (64 characters)	The text name of the switch model to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. Examples: "Unified Communications Manager," " MD110."	DisplayName
	MediaSwitchManufacturerObjectId	char (36 characters)	The unique identifier of the MediaSwitchManufacturer who manufactures this switch model.	ObjectId
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique identifier for a MediaSwitchModel object.	ObjectId

Stored Procedures

Name	Description
csp_MediaSwitchModelCreate	Creates a new MediaSwitchModel object by inserting a new row into tbl_MediaSwitchModel.
csp_MediaSwitchModelDelete	Deletes a MediaSwitchModel object from tbl_MediaSwitchModel as specified by the @ObjectId parameter.

Name	Description
csp_MediaSwitchModelModify	Updates the attributes of a MediaSwitchModel object based on the values passed in via the parameters. The @ObjectId parameter identifies the MediaSwitchModel object that is updated.

Column Properties

DefaultMediaSwitchDisplayName

Property Name	Value
Description:	The default value for the display name of a media switch (tbl_MediaSwitch.DisplayName) when a MediaSwitch object of this model is created.
Notes:	<p>When the a user creates a new switch via the administrative console, the administrative interface will populate the DisplayName column of the new MediaSwitch object with this value.</p> <p>Example: Say the user wants to create a new "Phone System" (MediaSwitch). The administrative interface asks the user to select from a list of mfg/models. The user picks the entry that corresponds to this row in MediaSwitchModel:</p> <ul style="list-style-type: none"> * Moniker = "CCM" * MediaSwitchManufacturerMoniker="CISCO" * DisplayName = "Unified Communications Manager" * DefaultMediaSwitchDisplayName="Cisco Unified Communications Manager" <p>Administrative interface then creates a new "Phone System" object (MediaSwitch) with these attributes:</p> <ul style="list-style-type: none"> * DisplayName = "Cisco Unified Communications Manager" * MediaSwitchModelMoniker = "CCM"
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitchModel.DefaultMediaSwitchDisplayName

5.116. vw_MediaSwitchTrunk

A simple view for tbl_MediaSwitchTrunk.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	FromMediaSwitchDisplayName	nvarchar (64 characters)	The text name of the 'from' Media Switch.	DisplayName
	FromMediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object on which the call originates.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MediaTrunk object.	ObjectID
	ToMediaSwitchDisplayName	nvarchar (64 characters)	The text name of the "to" Media Switch.	DisplayName
	ToMediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to which the call is directed.	ObjectID
	TrunkAccessCode	nvarchar (10 characters)	The DTMF digit sequence Cisco Unity Connection uses to transfer a call from one switching system to another (FromMediaSwitchObjectId to ToMediaSwitchObjectId).	

Stored Procedures

Name	Description
csp_MediaSwitchTrunkCreate	Creates a new MediaSwitchTrunk object by inserting a new row into tbl_MediaSwitchTrunk.
csp_MediaSwitchTrunkDelete	Deletes a MediaSwitchTrunk object from tbl_MediaSwitchTrunk as specified by the @ObjectId parameter.

Column Properties

FromMediaSwitchDisplayName

Property Name	Value
Description:	The text name of the 'from' Media Switch.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.DisplayName
Primary Key:	False
Allow Null:	False

Property Name	Value
Validation - Maximum Value:	

5.117. vw_MenuEntry

A simple view for tbl_MenuEntry.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
PK	CallHandlerObjectId	char (36 characters)	The unique identifier of the CallHandler object to which this menu entry belongs.	ObjectID
	Locked	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection ignores additional input after callers press this key. Values: 0: Additional input accepted 1: Additional input ignored; Cisco Unity Connection performs the action assigned to the key.	Bool
	TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
PK	TouchtoneKey	nvarchar (32 characters)	The character on the touch-tone keypad that this menu entry corresponds to (*, #, 0,1...9).	

Stored Procedures

Name	Description
csp_MenuEntryCreate	Creates a new user input key mappings by inserting a new row into tbl_MenuEntry.
csp_MenuEntryModify	Updates the attributes of a MenuEntry object based on the values passed in via the parameters. Essentially, only the Locked attribute is updated. If @TargetConversation is specified, the associated CallAction object is updated. If @TargetHandlerObjectId is specified, the associated CallAction object is updated. If @Action is not NULL, the associated CallAction object is updated. The combination of the @CallHandlerObjectId and @TouchtoneKey parameters identifies the MenuEntry object that is updated.

Column Properties

Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action

Validation - Maximum Value:	

Locked

Property Name	Value
Description:	<p>A flag indicating whether Cisco Unity Connection ignores additional input after callers press this key.</p> <p>Values: 0: Additional input accepted 1: Additional input ignored; Cisco Unity Connection performs the action assigned to the key.</p>
Notes:	<p>A locked menu entry does not allow additional dialing after this choice is entered, but Cisco Unity Connection will immediately take the associated action. If the action is set to "Ignore" (0), the key is thrown out and the greeting continues playing as normal. Any other action is taken immediately without waiting to determine if the caller is going to dial an extension.</p> <p>If tbl_Greeting->IgnoreDigits = 1, it overrides this setting and has the effect of automatically locking all keys for that call handler. (In Unity 4.x SA, this is the "Allow Caller Input" check-box on the call handler or subscriber "Greetings" page.)</p> <p>Values: 0: Unlocked - Additional dialing after this choice is entered is allowed 1: Locked - Additional dialing is ignored</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MenuEntry.Locked
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation

Validation - Minimum Length:	1 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.118. vw_MessageAgingPolicy

Simple view for tbl_AgingPolicy

A policy for all associated mailboxes which allows messages to be automatically removed from a user's mailbox after a specified period.

Additional Information

A policy is composed of 0-n AgingRule objects. The details of how the messages are aged is contained in the MessageAgingRules.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The text name of this MessageAgingPolicy. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	
	Enabled	smallint (2 bytes)	A flag indicating whether the policy is enabled.	Bool
	IsSystem	smallint (2 bytes)	A flag indicating whether this policy was created during default system configuration.	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MessageAgingPolicy object.	ObjectID

Stored Procedures

Name	Description
csp_MessageAgingPolicyCreate	Creates a new message aging policy by inserting a new row into tbl_MessageAgingPolicy.
csp_MessageAgingPolicyDelete	Deletes a MessageAgingPolicy object from tbl_MessageAgingPolicy as specified by the @ObjectId parameter.
csp_MessageAgingPolicyModify	Updates the attributes of a MessageAgingPolicy object based on the values passed in via the parameters. The @ObjectId parameter identifies the MessageAgingPolicy object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The text name of this MessageAgingPolicy. Used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MessageAgingPolicy.DisplayName

5.119. vw_MessageAgingRule

Simple view for tbl_AgingRule

A collection of attributes that indicate how to age a group of messages.

Additional Information

Examples:

A rule where Days=7, Deleted=0, Seen=1 and Action=SoftDelete will delete all message which are not deleted, but have been read after 7 days from the last modification to the message. The action indicates that these messages will be marked as deleted, rather than removing the messages from the system.

A rule where Days=15, Deleted=1, Seen=NULL and Action=HardDelete will delete all message new and read messages which are in the deleted state after 15 days from the last modification to the message. The action indicates that these messages will be permanently removed from system.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Action	int (4 bytes)	Describes the action to take when the rule is applied.	AgingRuleAction
	AgingTimeType	int (4 bytes)	This defines what column to use (modificationtime or arrivaltime) when calculating messages to age.	AgingTimeType
	Days	int (4 bytes)	Age message older than this number of days.	
	Deleted	smallint (2 bytes)	Apply this rule to messages where UnityMbxDb.tbl_FolderItem.Deleted is equal to this value.	Bool
	Enabled	smallint (2 bytes)	If not true, then don't apply this rule as part of the message aging policy	Bool
	MessageAgingPolicyObjectId	char (36 characters)	The objectid of the MessageAgingPolicy to which this rule belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a MessageAgingRule object.	ObjectID
	Recent	smallint (2 bytes)	Apply this rule to messages where tbl_FolderItem.Recent is equal to this value.	Bool
	Secure	smallint (2 bytes)	Apply this rule to messages where tbl_Message.Secure is equal to this value.	Bool
	Seen	smallint (2 bytes)	Apply this rule to messages where tbl_FolderItem.Seen is equal to this value.	Bool

Stored Procedures

Name	Description
csp_MessageAgingRuleCreate	Creates a new message aging rule by inserting a new row into tbl_MessageAgingRule.
csp_MessageAgingRuleDelete	Deletes a MessageAgingRule object from tbl_MessageAgingRule as specified by the @ObjectId parameter.
csp_MessageAgingRuleModify	Updates the attributes of a MessageAgingRule object based on the values passed in via the parameters. The @ObjectId parameter identifies the MessageAgingRule object that is updated.

Column Properties

Action

Property Name	Value
Description:	Describes the action to take when the rule is applied.
Notes:	Values: 0: 1:
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MessageAgingRule.Action
Primary Key:	False

5.120. vw_Nickname

A simple view for tbl_Nickname.

A familiar or shortened form of a user or contact's proper name, which is used by the VUI for name recognition. This is a global table for the VMS.

Additional Information

Example: For the proper name of Edward, there are nicknames such as Ed, Eddie, and Eddy. Each of which would be a nickname in this table associated with the CanonicalName of Edward.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CanonicalName	nvarchar (64 characters)	The proper name for a contact or user for which a Nickname is associated.	DisplayName
	Nickname	nvarchar (64 characters)	A nick name associated with the name.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Nickname object.	ObjectID

Stored Procedures

Name	Description
csp_NicknameCreate	Creates a new Nickname object by inserting a new row into tbl_Nickname.
csp_NicknameDelete	Deletes a Nickname object from tbl_Nickname as specified by the @ObjectId parameter.
csp_NicknameModify	Updates the attributes of a Nickname object based on the values passed in via the parameters. The @ObjectId parameter identifies the Nickname object that is updated.

Column Properties

CanonicalName

Property Name	Value
Description:	The proper name for a contact or user for which a Nickname is associated.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Nickname.CanonicalName
Primary Key:	False

Validation - Maximum Value:	

5.121. vw_NotificationAllActiveDevices

This view shows all active devices for users on the system. If a user does not have a single active device then a row will be present for this user with deviceobjectid and mwioobjectid both set to null.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	DeviceDisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2," "Work Phone, " etc.	DisplayName
PK	DeviceObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDevice object.	ObjectID
	DeviceType	int (4 bytes)	The device type (Dial, Numeric Pager, SMTP, Fax).	Delivery-DeviceType
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	FailRuleObjectId	char (36 characters)	The unique identifier of the NotificationRule object that Cisco Unity Connection will run if attempted notification to the device specified in this rule fails.	ObjectID
	IncludeFaxMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a FAX message.	Bool
	IncludeTextMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a text message.	Bool
	IncludeVoiceMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a voice message.	Bool
	InitialDelay	int (4 bytes)	The amount of time (in minutes) from the time a message is received until the message notification triggers (if the message matches the criteria).	
PK	MailboxId	nvarchar (110 characters)	The identifier of a single mailbox on the specified mailbox store.	
	MediaPortObjectId	char (36 characters)	The unique identifier of the MediaPort object Cisco Unity Connection uses to set MWI.	ObjectID
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to use for activating/deactivating the MWI.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MwiDisplayName	nvarchar (64 characters)	The unique text name of this notification MWI to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Office Phone" or " Lab Phone."	DisplayName
	MwiExtension	nvarchar (40 characters)	The phone number (extension) of the MWI to activate.	PhoneNumber E123_Required
PK	MwiObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationMwi object.	ObjectID
	MwiOn	smallint (2 bytes)	A flag indicating whether the MWI is on or off. This is the state of the MWI from the perspective of Cisco Unity Connection.	Bool
	RepeatInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait before re-notifying a subscriber of new messages.	
	RepeatNotify	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection begins a notification process immediately upon the arrival of each message that matches the specified criteria.	Bool
	RuleDisplayName	nvarchar (64 characters)	The text name for this notification rule to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
PK	RuleObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationRule object.	ObjectID
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the ScheduleSet object that specifies the schedule for this notification rule.	ObjectID
	SubscriberDisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
PK	SubscriberObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID
	TimeZone	int (4 bytes)	The time zone to which this user account is associated.	

Stored Procedures

vw_NotificationAllActiveDevices has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters

SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\~_\.@,;\+\\ %\?^\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FailRuleObjectId

Property Name	Value
Description:	The unique identifier of the NotificationRule object that Cisco Unity Connection will run if attempted notification to the device specified in this rule fails.
Notes:	Note that the notification device associated with the specified failed rule does not have to be active.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.FailRuleObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeFaxMessages

Property Name	Value
Description:	A flag indicating whether the MWI should be set for a FAX message.
Notes:	Values: 0: Do not set MWI for fax message. 1: Set MWI for fax message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.IncludeFaxMessages
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeTextMessages

Property Name	Value
Description:	A flag indicating whether the MWI should be set for a text message.
Notes:	Values: 0: Do not set MWI for text message. 1: Set MWI for text message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.IncludeTextMessages
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeVoiceMessages

Property Name	Value
Description:	A flag indicating whether the MWI should be set for a voice message.
Notes:	Values: 0: Do not set MWI for voice message. 1: Set MWI for voice message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.IncludeVoiceMessages
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

InitialDelay

Property Name	Value
Description:	The amount of time (in minutes) from the time a message is received until the message notification triggers (if the message matches the criteria).
Notes:	If the delay time takes the notification out to a time when the device schedule is no longer active, the notification does not take place.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.InitialDelay
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	120

MailboxId

Property Name	Value
Description:	The identifier of a single mailbox on the specified mailbox store.
Notes:	For users with mailboxes on UMSS, the objectid of the UMSS mailbox object is contained here. For users with mailboxes on an other mail store such as Exchange or Domino, the user's legacy Exchange DN or primary SMTP address is stored here.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (110 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	110 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaPortObjectId

Property Name	Value
Description:	The unique identifier of the MediaPort object Cisco Unity Connection uses to set MWI.
Notes:	This information is needed by the Notifier to set MWI for some switches that require that the same port that turned ON a MWI must also turn OFF that same MWI.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.MediaPortObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to use for activating/deactivating the MWI.
Notes:	FK to tbl_MediaSwitchObjectId
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.MediaSwitchObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiDisplayName

Property Name	Value
Description:	The unique text name of this notification MWI to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Office Phone" or " Lab Phone."
Notes:	The text name must be unique for each subscriber.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiExtension

Property Name	Value
Description:	The phone number (extension) of the MWI to activate.
Notes:	NULL means use the subscriber's extension.
Business Rules:	Multiple MWI extensions must be unique for a single subscriber.
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.MwiExtension
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	PhoneNumberE123_Required
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,,]+\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationMwi object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MwiOn

Property Name	Value
Description:	A flag indicating whether the MWI is on or off. This is the state of the MWI from the perspective of Cisco Unity Connection.

Property Name	Value
Notes:	Values: 0: MWI is off 1: MWI is on
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.MwiOn
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RepeatInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait before re-notifying a subscriber of new messages.
Notes:	Cisco Unity Connection attempts notification immediately after the first message, and then initiates a notification schedule based on the specified interval. The notification schedule is effective for as long as the subscriber has one or more new messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.RepeatInterval
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	60

RepeatNotify

Property Name	Value
Description:	A flag indicting whether Cisco Unity Connection begins a notification process immediately upon the arrival of each message that matches the specified criteria.
Notes:	<p>In other words, if this subscriber has unopened messages of types set up in this rule's events, then repeatedly notify him/her until the schedule expires or the messages are opened. This is independent of each/batch designations.</p> <p>Cisco Unity Connection considers notification successful if the device answers, even if new messages remain. (For example, notification is considered successful even when an answering machine picks up and records the message, but the message remains unread in the mailbox.)</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.RepeatNotify
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RuleDisplayName

Property Name	Value
Description:	The text name for this notification rule to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	Not relevant since there can only be one notification rule per notification device.
Business Rules:	The DisplayName must be unique for a User.
Developer Notes:	Since DisplayName is no longer relevant, it should be deprecated.
Table/Column Mapping:	tbl_NotificationRule.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)

Property Name	Value
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RuleObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationRule object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the ScheduleSet object that specifies the schedule for this notification rule.
Notes:	Created by default, but without any schedules.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.ScheduleSetObjectId
Primary Key:	False

Property Name	Value
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberDisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	<p>The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns.</p> <p>If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a User object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	The time zone to which this user account is associated.
Notes:	<p>The TimeZone value refers to an entry in the table tbl_TimeZone.</p> <p>By default this value is NULL, which means the user is in the same time zone as the VMS on which their account resides. If, however, a user is checking messages from another time zone, this value can be set to associate them with any time zone.</p> <p>Since messages are all stored with time stamps in Universal Time Coordinated (UTC), Unity translates the times into the appropriate time zone on the fly when users are checking messages in the same way an email client does when showing you your inbox.</p>
Business Rules:	
Developer Notes:	In versions prior to Cisco Unity Connection, the bias was stored in the lower 16-bits of the integer and the upper 16-bits was reserved for an identifier.
Table/Column Mapping:	tbl_User.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.122. vw_NotificationDevice

A simple view for tbl_NotificationDevice.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	A flag indicating whether the device is active or inactive (enabled/disabled).	Bool
	AfterDialDigits	nvarchar (32 characters)	The extra digits (if any) that Cisco Unity Connection will dial after the phone number.	Notifica- tionDeviceAf- terDialDigits
	BusyRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.	
	Conversation	nvarchar (64 characters)	The name of the Conversation Cisco Unity Connection will use when calling the subscriber to notify of new messages. This maps to one of the conversations in tbl_Conversation.	Conversation- Name
	DetectTransferLoop	smallint (2 bytes)	A flag indicating whether Unity can do a loop detect transfer to this device.	Bool
	DeviceName	nvarchar (12 characters)	The "DeviceName" of the notification device.	Notifica- tionDevice- Name
	DialDelay	int (4 bytes)	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.	
	DisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2," "Work Phone, " etc.	DisplayName
	MaxBody	int (4 bytes)	The maximum number of characters allowed in the 'body' of a notification message.	
	MaxSubject	int (4 bytes)	The maximum number of characters allowed in the 'subject' of a notification message.	
	MediaSwitchDisplay- Name	nvarchar (64 characters)	The text name of the Media Switch.	DisplayName
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to use for notification.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDevice object.	ObjectID
	PhoneNumber	nvarchar (40 characters)	The phone number to dial, including the trunk access code (if any), of the device.	PhoneNumberE123
	PromptForId	smallint (2 bytes)	A flag indicating whether to prompt a subscriber for their Cisco Unity Connection ID, or just their password.	Bool
	RetriesOnBusy	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if it is busy.	
	RetriesOnRna	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.	
	RingsToWait	int (4 bytes)	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.	
	RnaRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.	
	SendCallerId	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.	Bool
	SendCount	smallint (2 bytes)	A flag indicting whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.	Bool
	SendPcaLink	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include a link to the PCA with the notification message.	Bool
	SmppProviderObjectId	char (36 characters)	The unique identifier of the SMPPProvider object that is used by this notification device.	ObjectID
	SmtAddress	lvarchar (320 characters)	The e-mail address of the text pager, text-compatible cell phone, or another e-mail account (such as a home e-mail address) to which the notification message is to be sent. In the SA, this is referred to as the "To:" field.	EmailAddress
	StaticText	lvarchar (256 characters)	The actual text message that the subscriber wants to receive in a Text Pager notification. The SA refers to this as the "Send:" field.	
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification device belongs.	ObjectID
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicating whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.	Bool
	Type	int (4 bytes)	The device type (Dial, Numeric Pager, SMTP, Fax).	Delivery-DeviceType

Key	Name	SQL Data Type/Length	Description	Custom Type
	Undeletable	smallint (2 bytes)	Device cannot be deleted.	Bool
	WaitConnect	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.	Bool

Stored Procedures

vw_NotificationDevice has no stored procedures.

Column Properties

Active

Property Name	Value
Description:	A flag indicating whether the device is active or inactive (enabled/disabled).
Notes:	Values: 0: Device is inactive (disabled) 1: Device is active (enabled)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.Active
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterDialDigits

Property Name	Value
Description:	The extra digits (if any) that Cisco Unity Connection will dial after the phone number.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.AfterDialDigits
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	NotificationDeviceAfterDialDigits
SQL Data Type/Length:	nvarchar (32 characters)
Validation - Expression:	^[0-9Tt,*#]*\$
Validation - Description:	ASCII digits 0-9, T, t comma, hash and asterisk only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

BusyRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.BusyRetryInterval
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

Conversation

Property Name	Value
Description:	The name of the Conversation Cisco Unity Connection will use when calling the subscriber to notify of new messages. This maps to one of the conversations in tbl_Conversation.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.Conversation
Primary Key:	False
Allow Null:	False
Default Value:	SubNotify
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DetectTransferLoop

Property Name	Value
Description:	A flag indicating whether Unity can do a loop detect transfer to this device.
Notes:	Values 0: Loop detect transfers to this device are NOTallowed 1: Loop detect transfers are allowed to this device
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.DetectTransferLoop
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DeviceName

Property Name	Value
Description:	The "DeviceName" of the notification device.
Notes:	<p>This is really more of a "tag" than a name - the sole purpose of this column is to "tag" a device so that it may be modified via a conversation. The DisplayName is the viewable/editable name of the device.</p> <p>Values: Home Phone: Home phone notification device. Mobile Phone: Mobile phone notification device. Other: None of the above. The conversation will ignore these. Pager: Numeric pager notification device. SMS: SMS notification device. SMTP: SMTP notification device. Spare Phone: *** obsolete. Temporary until removed from conversations Work Phone: Work phone notification device.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DeviceName
Primary Key:	False
Allow Null:	False
Default Value:	Other
Custom Type:	NotificationDeviceName
SQL Data Type/Length:	nvarchar (12 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialDelay

Property Name	Value
Description:	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.
Notes:	This option can be used if the automatic call progress detection is not reliable (for example, when phone lines are noisy or when ringing patterns are unusual).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.DialDelay
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	1
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

DisplayName

Property Name	Value
Description:	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," "Pager 2," "Work Phone, " etc.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxBody

Property Name	Value
Description:	The maximum number of characters allowed in the 'body' of a notification message.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Body. MaxBody seems to be overloaded to mean "urgent override" for AMIS.
Table/Column Mapping:	tbl_NotificationDevice.MaxBody
Primary Key:	False
Allow Null:	False
Default Value:	512
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxSubject

Property Name	Value
Description:	The maximum number of characters allowed in the 'subject' of a notification message.
Notes:	
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Subject. A maximum size of 4096 was set arbitrarily.
Table/Column Mapping:	tbl_NotificationDevice.MaxSubject
Primary Key:	False
Allow Null:	False
Default Value:	64
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	4096

MediaSwitchDisplayName

Property Name	Value
Description:	The text name of the Media Switch.
Notes:	
Business Rules:	
Developer Notes:	This column needs to map to tbl_MedaSwitch.DisplayName for the view to work correctly.
Table/Column Mapping:	tbl_MediaSwitch.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to use for notification.
Notes:	FK to tbl_MediaSwitchObjectId.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.MediaSwitchObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationDevice object.
Notes:	
Business Rules:	
Developer Notes:	Surrogate key - for lookups mainly.
Table/Column Mapping:	tbl_NotificationDevice.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PhoneNumber

Property Name	Value
Description:	The phone number to dial, including the trunk access code (if any), of the device.
Notes:	Allowable characters are digits 0-9, and comma to insert one-second pause, and hash (" # ") and star (" * ") corresponding to these keys on the phone.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.PhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

PromptForId

Property Name	Value
Description:	A flag indicating whether to prompt a subscriber for their Cisco Unity Connection ID, or just their password.
Notes:	1: SubNotify conversation shall prompt for subscriber ID and password (baseline system behavior) before access to the subscriber's mailbox is granted. 0: SubNotify conversation shall prompt only for the associated subscriber password before access to the subscriber's mailbox is granted.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.PromptForId
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RetriesOnBusy

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if it is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RetriesOnBusy
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	

Property Name	Value
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RetriesOnRna

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RetriesOnRna
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RingsToWait

Property Name	Value
Description:	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RingsToWait

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

RnaRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RnaRetryInterval
Primary Key:	False
Allow Null:	False
Default Value:	15
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

SendCallerId

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.SendCallerId
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendCount

Property Name	Value
Description:	A flag indicting whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.
Notes:	Values: 0: Do not send subscriber message counts. 1: Send subscriber message counts.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.SendCount
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendPcaLink

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include a link to the PCA with the notification message.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SendPcaLink
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SmppProviderObjectId

Property Name	Value
Description:	The unique identifier of the SMPPProvider object that is used by this notification device.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMS.SmppProviderObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtAddress

Property Name	Value
Description:	The e-mail address of the text pager, text-compatible cell phone, or another e-mail account (such as a home e-mail address) to which the notification message is to be sent. In the SA, this is referred to as the "To:" field.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SmtAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	EmailAddress
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

StaticText

Property Name	Value
Description:	The actual text message that the subscriber wants to receive in a Text Pager notification. The SA refers to this as the "Send:" field.
Notes:	Typically holds e-mail address. If the DeviceName is "TextforVMI," this column will contain the URL for the Cisco Personal Communications Assistant so that it is automatically included as a link in the body of the e-mail message that is sent to the notification device.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.StaticText
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification device belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TransmitForcedAuthorizationCode

Property Name	Value
Description:	A flag indicating whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.
Notes:	Values: 0: Do not transmit an authorization code 1: An authorization code must be transmitted to Cisco Call Manager
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.TransmitForcedAuthorizationCode
Primary Key:	False
Allow Null:	False
Default Value:	0

Property Name	Value
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Type

Property Name	Value
Description:	The device type (Dial, Numeric Pager, SMTP, Fax).
Notes:	Values: 1: Dialable phone device. 2: Numeric pager. 3: Fax (not used in Cisco Unity Connection). 4: SMTP address. 5: SMS device. 7: MP3 Device.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.Type
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	DeliveryDeviceType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	Device cannot be deleted.

Property Name	Value
Notes:	For notification devices that are controlled via the TUI and created by default.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WaitConnect

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.
Notes:	Values: 0: Do not wait until a connection is detected before dialing the digits in AfterDialDigits. 1: Wait until a connection is detected before dialing the digits in AfterDialDigits.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.WaitConnect
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.123. vw_NotificationDeviceConversation

A of tbl_NotificationDeviceConversation along with the properties from the base object tbl_NotificationDevice.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	A flag indicating whether the device is active or inactive (enabled/disabled).	Bool
	AfterDialDigits	nvarchar (32 characters)	The extra digits (if any) that Cisco Unity Connection will dial after the phone number.	Notifica- tionDeviceAf- terDialDigits
	BusyRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.	
	Conversation	nvarchar (64 characters)	The name of the Conversation Cisco Unity Connection will use when calling the subscriber to notify of new messages. This maps to one of the conversations in tbl_Conversation.	Conversation- Name
	DetectTransferLoop	smallint (2 bytes)	A flag indicating whether Unity can do a loop detect transfer to this device.	Bool
	DeviceName	nvarchar (12 characters)	The "DeviceName" of the notification device.	Notifica- tionDevice- Name
	DialDelay	int (4 bytes)	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.	
	DisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2," "Work Phone, " etc.	DisplayName
	MaxBody	int (4 bytes)	The maximum number of characters allowed in the 'body' of a notification message.	
	MaxSubject	int (4 bytes)	The maximum number of characters allowed in the 'subject' of a notification message.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to use for notification.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDeviceConversation object.	ObjectID
	PhoneNumber	nvarchar (40 characters)	The phone number to dial, including the trunk access code (if any), of the device.	PhoneNumber E123
	PromptForId	smallint (2 bytes)	A flag indicating whether to prompt a subscriber for their Cisco Unity Connection ID, or just their password.	Bool
	RetriesOnBusy	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if it is busy.	
	RetriesOnRna	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.	
	RingsToWait	int (4 bytes)	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.	
	RnaRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.	
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification device belongs.	ObjectID
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicating whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.	Bool
	Undeletable	smallint (2 bytes)	Notification device is undeletable.	Bool
	WaitConnect	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.	Bool

Stored Procedures

Name	Description
csp_NotificationDeviceConversationCreate	Creates a new NotificationDeviceConversation object by inserting a new row into tbl_NotificationDeviceConversation. It also creates all the sub objects for a NotificationDevice such as a NotificationRule, NotificationRuleCriteria and NotificationRuleEvent. In addition it also creates a new NotificationDevice object (base object for a NotificationDeviceConversation object) by inserting a new row into tbl_NotificationDevice. A NotificationDeviceConversation object contains the parameters and settings (phonenummer, ringstowait, etc.) for a dialable phone notification device.
csp_NotificationDeviceConversationDelete	Deletes a NotificationDeviceConversation object from tbl_NotificationDeviceConversation and the associated NotificationDevice object from tbl_NotificationDevice as specified by the @ObjectId parameter.

Name	Description
csp_NotificationDeviceConversationModify	Updates the attributes of a NotificationDeviceConversation object and its associated NotificationDevice object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationDeviceConversation and NotificationDevice objects that are updated.

Column Properties

Active

Property Name	Value
Description:	A flag indicating whether the device is active or inactive (enabled/disabled).
Notes:	Values: 0: Device is inactive (disabled) 1: Device is active (enabled)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.Active
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterDialDigits

Property Name	Value
Description:	The extra digits (if any) that Cisco Unity Connection will dial after the phone number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.AfterDialDigits

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	NotificationDeviceAfterDialDigits
SQL Data Type/Length:	nvarchar (32 characters)
Validation - Expression:	^[0-9Tt, *#]*\$
Validation - Description:	ASCII digits 0-9, T, t comma, hash and asterisk only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

BusyRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.BusyRetryInterval
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

Conversation

Property Name	Value
Description:	The name of the Conversation Cisco Unity Connection will use when calling the subscriber to notify of new messages. This maps to one of the conversations in tbl_Conversation.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.Conversation
Primary Key:	False
Allow Null:	False
Default Value:	SubNotify
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DetectTransferLoop

Property Name	Value
Description:	A flag indicating whether Unity can do a loop detect transfer to this device.
Notes:	Values 0: Loop detect transfers to this device are NOTallowed 1: Loop detect transfers are allowed to this device
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.DetectTransferLoop
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DeviceName

Property Name	Value
Description:	The "DeviceName" of the notification device.
Notes:	<p>This is really more of a "tag" than a name - the sole purpose of this column is to "tag" a device so that it may be modified via a conversation. The DisplayName is the viewable/editable name of the device.</p> <p>Values:</p> <p>Home Phone: Home phone notification device.</p> <p>Mobile Phone: Mobile phone notification device.</p> <p>Other: None of the above. The conversation will ignore these.</p> <p>Pager: Numeric pager notification device.</p> <p>SMS: SMS notification device.</p> <p>SMTP: SMTP notification device.</p> <p>Spare Phone: *** obsolete. Temporary until removed from conversations</p> <p>Work Phone: Work phone notification device.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DeviceName
Primary Key:	False
Allow Null:	False
Default Value:	Other
Custom Type:	NotificationDeviceName
SQL Data Type/Length:	nvarchar (12 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialDelay

Property Name	Value
Description:	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.
Notes:	This option can be used if the automatic call progress detection is not reliable (for example, when phone lines are noisy or when ringing patterns are unusual).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.DialDelay
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	1
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

DisplayName

Property Name	Value
Description:	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," "Pager 2," "Work Phone," etc.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxBody

Property Name	Value
Description:	The maximum number of characters allowed in the 'body' of a notification message.
Notes:	

Property Name	Value
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Body. MaxBody seems to be overloaded to mean "urgent override" for AMIS.
Table/Column Mapping:	tbl_NotificationDevice.MaxBody
Primary Key:	False
Allow Null:	False
Default Value:	512
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxSubject

Property Name	Value
Description:	The maximum number of characters allowed in the 'subject' of a notification message.
Notes:	
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Subject. A maximum size of 4096 was set arbitrarily.
Table/Column Mapping:	tbl_NotificationDevice.MaxSubject
Primary Key:	False
Allow Null:	False
Default Value:	64
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	4096

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to use for notification.
Notes:	FK to tbl_MediaSwitchObjectId.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.MediaSwitchObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationDeviceConversation object.
Notes:	The value of this objectid is the same as the objectid of its associated base object in tbl_NotificationDevice.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PhoneNumber

Property Name	Value
Description:	The phone number to dial, including the trunk access code (if any), of the device.
Notes:	Allowable characters are digits 0-9, and comma to insert one-second pause, and hash ("#") and star ("*") corresponding to these keys on the phone.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.PhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PromptForId

Property Name	Value
Description:	A flag indicating whether to prompt a subscriber for their Cisco Unity Connection ID, or just their password.
Notes:	1: SubNotify conversation shall prompt for subscriber ID and password (baseline system behavior) before access to the subscriber's mailbox is granted. 0: SubNotify conversation shall prompt only for the associated subscriber password before access to the subscriber's mailbox is granted.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.PromptForId
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RetriesOnBusy

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if it is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RetriesOnBusy
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RetriesOnRna

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RetriesOnRna
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RingsToWait

Property Name	Value
Description:	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RingsToWait
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

RnaRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.RnaRetryInterval
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	15
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification device belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TransmitForcedAuthorizationCode

Property Name	Value
Description:	A flag indicating whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.

Property Name	Value
Notes:	Values: 0: Do not transmit an authorization code 1: An authorization code must be transmitted to Cisco Call Manager
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.TransmitForcedAuthorizationCode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	Notification device is undeletable.
Notes:	The four devices that are accessible via the TUI need to exist at all times.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WaitConnect

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.
Notes:	Values: 0: Do not wait until a connection is detected before dialing the digits in AfterDialDigits. 1: Wait until a connection is detected before dialing the digits in AfterDialDigits.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceConversation.WaitConnect

5.124. vw_NotificationDevicePager

A of tbl_NotificationDevicePager along with the properties from the base object tbl_NotificationDevice.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	A flag indicating whether the device is active or inactive (enabled/disabled).	Bool
	AfterDialDigits	nvarchar (32 characters)	The extra digits (if any) that Cisco Unity Connection will dial after the phone number. For numeric pagers, the extra digits are shown on the pager display.	NotificationDeviceAfterDialDigits
	BusyRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.	
	DeviceName	nvarchar (12 characters)	The "DeviceName" of the notification device.	NotificationDeviceName
	DialDelay	int (4 bytes)	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.	
	DisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2, "Work Phone," etc.	DisplayName
	MaxBody	int (4 bytes)	The maximum number of characters allowed in the 'body' of a notification message.	
	MaxSubject	int (4 bytes)	The maximum number of characters allowed in the 'subject' of a notification message.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to use for notification.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDevicePager object.	ObjectID
	PhoneNumber	nvarchar (40 characters)	The phone number to dial, including the trunk access code, to send a page.	PhoneNumberE123
	RetriesOnBusy	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if it is busy.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	RetriesOnRna	int (4 bytes)	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.	
	RingsToWait	int (4 bytes)	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.	
	RnaRetryInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.	
	SendCallerId	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.	Bool
	SendCount	smallint (2 bytes)	A flag indicting whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.	Bool
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification device belongs.	ObjectID
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicting whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.	Bool
	Undeletable	smallint (2 bytes)	Device cannot be deleted.	Bool
	WaitConnect	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.	Bool

Stored Procedures

Name	Description
csp_NotificationDevicePagerCreate	Creates a new NotificationDevicePager object by inserting a new row into tbl_NotificationDevicePager. It also creates all the sub objects for a NotificationDevice such as a NotificationRule, NotificationRuleCriteria and NotificationRuleEvent. In addition, it also creates a new NotificationDevice object (base object for a NotificationDevicePager object) by inserting a new row in tbl_NotificationDevice. A NotificationDevicePager object contains the parameters and settings (sendcount, dialdelay, etc.) for a pager (via phone, not SMTP) notification device.
csp_NotificationDevicePagerDelete	Deletes a NotificationDevicePager object from tbl_NotificationDevicePager and the associated NotificationDevice object from tbl_NotificationDevice as specified by the @ObjectId parameter.
csp_NotificationDevicePagerModify	Updates the attributes of a NotificationDevicePager object and its associated NotificationDevice object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationDevicePager and NotificationDevice objects that are updated.

Column Properties

Active

Property Name	Value
Description:	A flag indicating whether the device is active or inactive (enabled/disabled).
Notes:	Values: 0: Device is inactive (disabled) 1: Device is active (enabled)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.Active
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AfterDialDigits

Property Name	Value
Description:	The extra digits (if any) that Cisco Unity Connection will dial after the phone number. For numeric pagers, the extra digits are shown on the pager display.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.AfterDialDigits
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	NotificationDeviceAfterDialDigits
SQL Data Type/Length:	nvarchar (32 characters)
Validation - Expression:	^[0-9Tt,*#]*\$

Property Name	Value
Validation - Description:	ASCII digits 0-9, T, t comma, hash and asterisk only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

BusyRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.BusyRetryInterval
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

DeviceName

Property Name	Value
Description:	The "DeviceName" of the notification device.

Property Name	Value
Notes:	<p>This is really more of a "tag" than a name - the sole purpose of this column is to "tag" a device so that it may be modified via a conversation. The DisplayName is the viewable/editable name of the device.</p> <p>Values:</p> <p>Home Phone: Home phone notification device.</p> <p>Mobile Phone: Mobile phone notification device.</p> <p>Other: None of the above. The conversation will ignore these.</p> <p>Pager: Numeric pager notification device.</p> <p>SMS: SMS notification device.</p> <p>SMTP: SMTP notification device.</p> <p>Spare Phone: *** obsolete. Temporary until removed from conversations</p> <p>Work Phone: Work phone notification device.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DeviceName
Primary Key:	False
Allow Null:	False
Default Value:	Other
Custom Type:	NotificationDeviceName
SQL Data Type/Length:	nvarchar (12 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DialDelay

Property Name	Value
Description:	The amount of time (in seconds) Cisco Unity Connection will wait after detecting a successful call before dialing specified additional digits (if any). Additional digits are contained in AfterDialDigits.
Notes:	This option can be used if the automatic call progress detection is not reliable (for example, when phone lines are noisy or when ringing patterns are unusual).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.DialDelay
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:

Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	4096

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object to use for notification.

Property Name	Value
Notes:	FK to tbl_MediaSwitchObjectId
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.MediaSwitchObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationDevicePager object.
Notes:	The value of this objectid is the same as the objectid of its associated base object in tbl_NotificationDevice.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PhoneNumber

Property Name	Value
Description:	The phone number to dial, including the trunk access code, to send a page.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.PhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RetriesOnBusy

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if it is busy.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.RetriesOnBusy
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RetriesOnRna

Property Name	Value
Description:	The number of times Cisco Unity Connection will retry the notification device if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.RetriesOnRna
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

RingsToWait

Property Name	Value
Description:	The number of rings Cisco Unity Connection will wait before hanging up if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.RingsToWait
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1

Property Name	Value
Validation - Maximum Value:	100

RnaRetryInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait between tries if the device does not answer.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.RnaRetryInterval
Primary Key:	False
Allow Null:	False
Default Value:	15
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

SendCallerId

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.SendCallerId
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendCount

Property Name	Value
Description:	A flag indicting whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.
Notes:	Values: 0: Do not send subscriber message counts. 1: Send subscriber message counts.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.SendCount
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification device belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.SubscriberObjectId

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TransmitForcedAuthorizationCode

Property Name	Value
Description:	A flag indicting whether an authorization code should be transmitted to Cisco Call Manager after this number is dialed during an outbound call.
Notes:	Values: 0: Do not transmit an authorization code 1: An authorization code must be transmitted to Cisco Call Manager
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.TransmitForcedAuthorizationCode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	Device cannot be deleted.
Notes:	For notification devices that are controlled via the TUI and created by default.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WaitConnect

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection waits until it detects a connection before dialing the digits in AfterDialDigits.
Notes:	Values: 0: Do not wait until a connection is detected before dialing the digits in AfterDialDigits. 1: Wait until a connection is detected before dialing the digits in AfterDialDigits.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevicePager.WaitConnect
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.125. vw_NotificationDeviceSMS

A view of tbl_NotificationDeviceSMS along with the properties from the base object tbl_NotificationDevice.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	A flag indicating whether the device is active or inactive (enabled/disabled).	Bool
	DeviceName	nvarchar (12 characters)	The "DeviceName" of the notification device.	Notifica- tionDevice- Name
	DisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2," "Work Phone," etc.	DisplayName
	MaxBody	int (4 bytes)	The maximum number of characters allowed in the 'body' of a notification message.	
	MaxSubject	int (4 bytes)	The maximum number of characters allowed in the 'subject' of a notification message.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDeviceSMS object.	ObjectID
	RecipientAddress	lvarchar (320 characters)	The phone number of the SMS-compatible device to receive the message. In CUSA, this is referred to as the "To:" field.	
	SendCallerId	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.	Bool
	SendCount	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	SenderAddress	nvarchar (40 characters)	The return phone number for the message notification. Typically, this column contains the number that the subscriber calls to check messages (i.e., pilot number for Cisco Unity Connection voice mail). If the SMPP Provider requires a source address for the server sending the message, the SMSC will overwrite this data with an IP address. In CUSA, this is referred to as the "From:" field.	
	SmppProviderObjectId	char (36 characters)	The unique identifier of the SMPPProvider object that is used by this notification device.	ObjectID
	StaticText	lvarchar (256 characters)	The text message that the subscriber wants to receive in a Text Pager notification. For Text Pager notifications only. The SA refers to this as the "Send:" field. Typically holds email address. Also holds text for text pagers. SA text pager calls this 'send text'. It is empty for numeric pagers.	
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification device belongs.	ObjectID
	Undeetable	smallint (2 bytes)	Device cannot be deleted.	Bool

Stored Procedures

Name	Description
csp_NotificationDeviceSMSCreate	Creates a new NotificationDeviceSMS object by inserting a new row into tbl_NotificationDeviceSMS. It also creates all the sub objects for a NotificationDevice such as a NotificationRule, NotificationRuleCriteria and NotificationRuleEvent. In addition, it also creates a new NotificationDevice object (base object for a NotificationDeviceSMS object) by inserting a new row into tbl_NotificationDevice. A NotificationDeviceSMS object contains the parameters and settings (sendcount, SMPPProviderObjectid, etc.) for a SMS notification device.
csp_NotificationDeviceSMSDelete	Deletes a NotificationDeviceSMS object from tbl_NotificationDeviceSMS and the associated NotificationDevice object from tbl_NotificationDevice as specified by the @ObjectId parameter.
csp_NotificationDeviceSMSModify	Updates the attributes of a NotificationDeviceSMS object and its associated NotificationDevice object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationDeviceSMS and NotificationDevice objects that are updated.

Column Properties

Active

Property Name	Value
Description:	A flag indicating whether the device is active or inactive (enabled/disabled).
Notes:	Values: 0: Device is inactive (disabled) 1: Device is active (enabled)
Business Rules:

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RecipientAddress

Property Name	Value
Description:	The phone number of the SMS-compatible device to receive the message. In CUSA, this is referred to as the "To:" field.
Notes:	The format and the number depends on the SMPP Provider. The provider may require that you include international country codes, beginning with a plus sign (+) and followed by the country code, area, city, or trunk code, and then the number for the device (for example, +12065551234). Do not start with a zero or the international dialing prefix. Do not include spaces, dashes, parentheses or other punctuation.
Business Rules:	
Developer Notes:	<p>In the View and stored procedures for a NotificationDeviceSMS, this column is named "RecipientAddress." The reason this column was not renamed to a more relevant name is due to the requirements for vw_NotificationDevice, which has an SmtAddress column that is common to all types notification devices.</p> <p>The character constraint for this column that allows any character except control characters is intentional. There are some SMPPProviders that don't exactly adhere to the specification and support other characters in this field other than digits for a phone number.</p>
Table/Column Mapping:	tbl_NotificationDeviceSMS.SmtAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters

SenderAddress

Property Name	Value
Description:	The return phone number for the message notification. Typically, this column contains the number that the subscriber calls to check messages (i.e., pilot number for Cisco Unity Connection voice mail). If the SMPP Provider requires a source address for the server sending the message, the SMSC will overwrite this data with an IP address. In CUSA, this is referred to as the "From:" field.
Notes:	
Business Rules:	
Developer Notes:	<p>In the View and stored procedures for a NotificationDeviceSMS, this column is named "ReplyToNumber." The reason this column was not renamed to a more relevant name is due to the requirements for vw_NotificationDevice, which has a PhoneNumber column that is common to all types notification devices.</p> <p>The character constraint for this column that allows any character except control characters is intentional. There are some SMPPProviders that allow users to enter text in this field, which will be forwarded to the SMS device.</p>
Table/Column Mapping:	tbl_NotificationDeviceSMS.PhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmppProviderObjectId

Property Name	Value
Description:	The unique identifier of the SMPPProvider object that is used by this notification device.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMS.SmppProviderObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

StaticText

Property Name	Value
Description:	The text message that the subscriber wants to receive in a Text Pager notification. For Text Pager notifications only. The SA refers to this as the "Send:" field. Typically holds email address. Also holds text for text pagers. SA text pager calls this 'send text'. It is empty for numeric pagers.
Notes:	The maximum length of 160 characters is derived from SMS specification.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMS.StaticText
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	160 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification device belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	Device cannot be deleted.
Notes:	For notification devices that are controlled via the TUI and created by default.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.126. vw_NotificationDeviceSMTP

A view of tbl_NotificationDeviceSMTP along with the properties from the base object tbl_NotificationDevice.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	A flag indicating whether the device is active or inactive (enabled/disabled).	Bool
	DeviceName	nvarchar (12 characters)	The "DeviceName" of the notification device.	Notifica- tionDevice- Name
	DisplayName	nvarchar (64 characters)	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," Pager 2," "Work Phone," etc.	DisplayName
	MaxBody	int (4 bytes)	The maximum number of characters allowed in the 'body' of a notification message.	
	MaxSubject	int (4 bytes)	The maximum number of characters allowed in the 'subject' of a notification message.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationDeviceSMTP object.	ObjectID
	PhoneNumber	varchar (40 characters)	The phone number or alphanumeric text (as applicable) for sending a notification message to a text-compatible cell phone or pager. In the SA, this is referred to as the "From:" field. Typically, this field contains the number that the subscriber calls to check messages.	
	SendCallerId	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.	Bool
	SendCount	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.	Bool
	SendPcaLink	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will include a link to the PCA with the notification message.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	SmtAddress	lvarchar (320 characters)	The e-mail address of the text pager, text-compatible cell phone, or another e-mail account (such as a home e-mail address) to which the notification message is to be sent. In the SA, this is referred to as the "To:" field.	EmailAddress
	StaticText	lvarchar (256 characters)	The actual text message that the subscriber wants to receive in a Text Pager notification. The SA refers to this as the "Send:" field.	
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification device belongs.	ObjectID
	Undeleteable	smallint (2 bytes)	Device cannot be deleted.	Bool

Stored Procedures

Name	Description
csp_NotificationDeviceSMTPCreate	Creates a new NotificationDeviceSMTP object by inserting a new row into tbl_NotificationDeviceSMTP. It also creates all the sub objects for a NotificationDevice such as a NotificationRule, NotificationRuleCriteria and NotificationRuleEvent. In addition, it also creates a new NotificationDevice object (base object for a NotificationDeviceSMTP object) by inserting a new row into tbl_NotificationDevice. A NotificationDeviceSMTP object contains the parameters and settings (sendcount, smtpaddress, etc.) for a SMTP notification device.
csp_NotificationDeviceSMTPDelete	Deletes a NotificationDeviceSMTP object from tbl_NotificationDeviceSMTP and the associated NotificationDevice object from tbl_NotificationDevice as specified by the @ObjectId parameter.
csp_NotificationDeviceSMTPModify	Updates the attributes of a NotificationDeviceSMTP object and its associated NotificationDevice object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationDeviceSMTP and NotificationDevice objects that are updated.

Column Properties

Active

Property Name	Value
Description:	A flag indicating whether the device is active or inactive (enabled/disabled).
Notes:	Values: 0: Device is inactive (disabled) 1: Device is active (enabled)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.Active

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DeviceName

Property Name	Value
Description:	The "DeviceName" of the notification device.
Notes:	<p>This is really more of a "tag" than a name - the sole purpose of this column is to "tag" a device so that it may be modified via a conversation. The DisplayName is the viewable/editable name of the device.</p> <p>Values:</p> <p>Home Phone: Home phone notification device.</p> <p>Mobile Phone: Mobile phone notification device.</p> <p>Other: None of the above. The conversation will ignore these.</p> <p>Pager: Numeric pager notification device.</p> <p>SMS: SMS notification device.</p> <p>SMTP: SMTP notification device.</p> <p>Spare Phone: *** obsolete. Temporary until removed from conversations</p> <p>Work Phone: Work phone notification device.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DeviceName
Primary Key:	False
Allow Null:	False
Default Value:	Other
Custom Type:	NotificationDeviceName
SQL Data Type/Length:	nvarchar (12 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of the notification device to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Home Phone," "Pager 2," "Work Phone," etc.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxBody

Property Name	Value
Description:	The maximum number of characters allowed in the 'body' of a notification message.
Notes:	
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Body. MaxBody seems to be overloaded to mean "urgent override" for AMIS.
Table/Column Mapping:	tbl_NotificationDevice.MaxBody
Primary Key:	False
Allow Null:	False
Default Value:	512
Custom Type:	
SQL Data Type/Length:	int (4 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxSubject

Property Name	Value
Description:	The maximum number of characters allowed in the 'subject' of a notification message.
Notes:	
Business Rules:	
Developer Notes:	RFC 822 doesn't enforce a limit on the size of Subject. A maximum size of 4096 was set arbitrarily.
Table/Column Mapping:	tbl_NotificationDevice.MaxSubject
Primary Key:	False
Allow Null:	False
Default Value:	64
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	4096

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationDeviceSMTP object.
Notes:	The value of this objectid is the same as the objectid of its associated base object in tbl_NotificationDevice.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.ObjectId

Property Name	Value
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PhoneNumber

Property Name	Value
Description:	The phone number or alphanumeric text (as applicable) for sending a notification message to a text-compatible cell phone or pager. In the SA, this is referred to as the "From:" field. Typically, this field contains the number that the subscriber calls to check messages.
Notes:	
Business Rules:	
Developer Notes:	Must be same type/length as PhoneNumberE123 custom type, but we can't use that here because we need to include alpha.
Table/Column Mapping:	tbl_NotificationDeviceSMTP.PhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendCallerId

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include the caller id (if available) with the notification message.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SendCallerId
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendCount

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include a count of each voice mail, fax, and e-mail message with the notification message. When the subscriber receives the notification, the message count appears as a line for each type of message.
Notes:	Values: 0: Do not send subscriber message counts. 1: Send subscriber message counts.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SendCount
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

SendPcaLink

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will include a link to the PCA with the notification message.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SendPcaLink
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtpAddress

Property Name	Value
Description:	The e-mail address of the text pager, text-compatible cell phone, or another e-mail account (such as a home e-mail address) to which the notification message is to be sent. In the SA, this is referred to as the "To:" field.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.SmtpAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	EmailAddress
SQL Data Type/Length:	lvarchar (320 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

StaticText

Property Name	Value
Description:	The actual text message that the subscriber wants to receive in a Text Pager notification. The SA refers to this as the "Send:" field.
Notes:	Typically holds e-mail address. If the DeviceName is "TextforVMI," this column will contain the URL for the Cisco Personal Communications Assistant so that it is automatically included as a link in the body of the e-mail message that is sent to the notification device.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDeviceSMTP.StaticText
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification device belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationDevice.SubscriberObjectId

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeletable

Property Name	Value
Description:	Device cannot be deleted.
Notes:	For notification devices that are controlled via the TUI and created by default.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.127. vw_NotificationMwi

A simple view for tbl_NotificationMwi.

Additional Information

If tbl_NotificationMwi is NULL, use the subscriber's primary DtmfAccessId.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Active	smallint (2 bytes)	Is this active?	Bool
	DisplayName	nvarchar (64 characters)	The unique text name of this notification MWI to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Office Phone" or " Lab Phone."	DisplayName
	IncludeFaxMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a FAX message.	Bool
	IncludeTextMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a text message.	Bool
	IncludeVoiceMessages	smallint (2 bytes)	A flag indicating whether the MWI should be set for a voice message.	Bool
	MediaPortObjectId	char (36 characters)	The unique identifier of the MediaPort object Cisco Unity Connection uses to set MWI.	ObjectID
	MediaSwitchDisplay-Name	nvarchar (64 characters)	The text name of the Media Switch.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object to use for activating/deactivating the MWI.	ObjectID
	MwiExtension	nvarchar (40 characters)	The phone number (extension) of the MWI to activate.	PhoneNumber E123_Required
	MwiOn	smallint (2 bytes)	A flag indicating whether the MWI is on or off. This is the state of the MWI from the perspective of Cisco Unity Connection.	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationMwi object.	ObjectID
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this MWI belongs.	ObjectID
	UsePrimaryExtension	smallint (2 bytes)	If set to true (1), the subscriber's primary extension is used (and will be the value contained in MwiExtension)	Bool

Stored Procedures

Name	Description
csp_NotificationMwiCreate	Creates a new NotificationMwi object by inserting a new row into tbl_NotificationMwi. A NotificationMwi object contains the properties for one of a subscriber's notification devices.
csp_NotificationMwiDelete	Deletes a NotificationMwi object from tbl_NotificationMwi as specified by the @ObjectId parameter.
csp_NotificationMwiModify	Updates the attributes of a NotificationMwi object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationMwi object that is updated.

Column Properties

Active

Property Name	Value
Description:	Is this active?
Notes:	1 means that it is active and the MWI will be turned on/off by the notifier.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.Active
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this notification MWI to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, "Office Phone" or " Lab Phone."
Notes:	The text name must be unique for each subscriber.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IncludeFaxMessages

Property Name	Value
Description:	A flag indicating whether the MWI should be set for a FAX message.
Notes:	Values: 0: Do not set MWI for fax message. 1: Set MWI for fax message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationMwi.IncludeFaxMessages
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool

5.128. vw_NotificationRule

A simple view for tbl_NotificationRule.

A group of settings for each notification device that control when and how notifications are sent to the first and subsequent devices.

Additional Information

Each notification device is associated with a notification rule, which determines the schedule the device is active for and whether notifications are repeated at what interval. The criteria and events that will cause the rule to trigger are defined in the NotificationCriteria and NotificationEvent tables.

This table contains all the notification rules for each subscriber on the local VMS.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The text name for this notification rule to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	FailRuleObjectId	char (36 characters)	The unique identifier of the NotificationRule object that Cisco Unity Connection will run if attempted notification to the device specified in this rule fails.	ObjectID
	InitialDelay	int (4 bytes)	The amount of time (in minutes) from the time a message is received until the message notification triggers (if the message matches the criteria).	
	NotificationDeviceObjectId	char (36 characters)	The unique identifier of the NotificationDevice object to use.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a NotificationRule object.	ObjectID
	RepeatInterval	int (4 bytes)	The amount of time (in minutes) Cisco Unity Connection will wait before re-notifying a subscriber of new messages.	
	RepeatNotify	smallint (2 bytes)	A flag indicting whether Cisco Unity Connection begins a notification process immediately upon the arrival of each message that matches the specified criteria.	Bool
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the ScheduleSet object that specifies the schedule for this notification rule.	ObjectID
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this notification rule belongs.	ObjectID

Stored Procedures

Name	Description
csp_NotificationRuleCreate	Creates a new NotificationRule object by inserting a new row into tbl_NotificationRule. A NotificationRule object specifies when and which NotificationDevice is used for notification of new messages.
csp_NotificationRuleModify	Updates the attributes of a NotificationRule object based on the values passed in via the parameters. The @ObjectId parameter identifies the NotificationRule object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The text name for this notification rule to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	Not relevant since there can only be one notification rule per notification device.
Business Rules:	The DisplayName must be unique for a User.
Developer Notes:	Since DisplayName is no longer relevant, it should be deprecated.
Table/Column Mapping:	tbl_NotificationRule.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FailRuleObjectId

Property Name	Value
Description:	The unique identifier of the NotificationRule object that Cisco Unity Connection will run if attempted notification to the device specified in this rule fails.

Property Name	Value
Notes:	Note that the notification device associated with the specified failed rule does not have to be active.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.FailRuleObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

InitialDelay

Property Name	Value
Description:	The amount of time (in minutes) from the time a message is received until the message notification triggers (if the message matches the criteria).
Notes:	If the delay time takes the notification out to a time when the device schedule is no longer active, the notification does not take place.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.InitialDelay
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	120

NotificationDeviceObjectId

Property Name	Value
Description:	The unique identifier of the NotificationDevice object to use.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.NotificationDeviceObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a NotificationRule object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RepeatInterval

Property Name	Value
Description:	The amount of time (in minutes) Cisco Unity Connection will wait before re-notifying a subscriber of new messages.
Notes:	Cisco Unity Connection attempts notification immediately after the first message, and then initiates a notification schedule based on the specified interval. The notification schedule is effective for as long as the subscriber has one or more new messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.RepeatInterval
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	60

RepeatNotify

Property Name	Value
Description:	A flag indicting whether Cisco Unity Connection begins a notification process immediately upon the arrival of each message that matches the specified criteria.
Notes:	<p>In other words, if this subscriber has unopened messages of types set up in this rule's events, then repeatedly notify him/her until the schedule expires or the messages are opened. This is independent of each/batch designations.</p> <p>Cisco Unity Connection considers notification successful if the device answers, even if new messages remain. (For example, notification is considered successful even when an answering machine picks up and records the message, but the message remains unread in the mailbox.)</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.RepeatNotify
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the ScheduleSet object that specifies the schedule for this notification rule.
Notes:	Created by default, but without any schedules.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.ScheduleSetObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this notification rule belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRule.SubscriberObjectId
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.129. vw_NotificationRuleCriteria

A simple view for tbl_NotificationRuleCriteria.

A test or set of conditions that will trigger a notification rule.

Additional Information

There will be one row per criterion that is enabled for a notification rule. Criteria are pre-defined and specified by an integer value (see the NotificationCriteria column).

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	NotificationCriteria	int (4 bytes)	The criteria under which a notification rule will run, such as when there is a pending voice mail message.	NotificationRuleCriteria
PK	NotificationRuleObjectId	char (36 characters)	The unique identifier of the NotificationRule object for which this criteria applies.	ObjectID

Stored Procedures

Name	Description
csp_NotificationRuleCriteriaCreate	Creates a new NotificationRuleCriteria object by inserting a new row into tbl_NotificationRuleCriteria. A NotificationRuleCriteria object specifies the criteria that will trigger a notification rule.
csp_NotificationRuleCriteriaDelete	Deletes a NotificationRuleCriteria object from tbl_NotificationRuleCriteria as specified by the @ObjectId parameter.

Column Properties

NotificationCriteria

Property Name	Value
Description:	The criteria under which a notification rule will run, such as when there is a pending voice mail message.

Property Name	Value
Notes:	Values: 1: Pending voice mail. 2: Pending urgent voice mail message. 3: Pending e-mail message. 4: Pending urgent e-mail message. 5: Pending fax message. 6: Pending urgent fax message. 7: Pending message of any type 8: Pending urgent message of any type.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRuleCriteria.NotificationCriteria
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	NotificationRuleCriteria
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NotificationRuleObjectId

Property Name	Value
Description:	The unique identifier of the NotificationRule object for which this criteria applies.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRuleCriteria.NotificationRuleObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

5.130. vw_NotificationRuleEvent

A simple view for tbl_NotificationRuleEvent.

An event such as the first urgent voice mail message, which will trigger a message notification rule.

Additional Information

There will be one row per event that should be enabled for a notification rule.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	NotificationEvent	int (4 bytes)	The actual event to enable for a notification rule, such as for the first urgent voice mail message.	NotificationRuleEvent
PK	NotificationRuleObjectId	char (36 characters)	The unique identifier of the NotificationRule object for which this event applies.	ObjectID

Stored Procedures

Name	Description
csp_NotificationRuleEventCreate	Creates a new NotificationRuleEvent object by inserting a new row into tbl_NotificationRuleEvent. A NotificationRuleEvent object specifies the message notification event for a notification rule that triggers notification rule.
csp_NotificationRuleEventDelete	Deletes a NotificationRuleEvent object from tbl_NotificationRuleEvent as specified by the @ObjectId parameter.

Column Properties

NotificationEvent

Property Name	Value
Description:	The actual event to enable for a notification rule, such as for the first urgent voice mail message.

Property Name	Value
Notes:	Values: 0: None 1: First voice mail message. 10: First urgent fax message. 11: New fax message. 12: New urgent fax message. 13: First message of any type. 14: First urgent message of any type. 15: New message of any type. 16: New urgent message of any type. 17: Runs when schedule becomes active 2: First urgent voice mail message. 3: New voice mail message. 4: New urgent voice mail message. 5: First e-mail message. 6: First urgent email message. 7: New e-mail message. 8: New urgent e-mail message. 9: First fax message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRuleEvent.NotificationEvent
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	NotificationRuleEvent
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NotificationRuleObjectId

Property Name	Value
Description:	The unique identifier of the NotificationRule object for which this event applies.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_NotificationRuleEvent.NotificationRuleObjectId
Primary Key:	True
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.131. vw_PersonalContact

A simple view for tbl_PersonalContact.

The basic contact information for a person or entity (e.g., business) who is not a Cisco Unity Connection user.

Additional Information

Used for PA subscriber features along with CallerID, and perhaps more eventually.

A tool to import these from existing PIMs would be nice...

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AltFirstName	nvarchar (64 characters)	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.	AltName
	AltLastName	nvarchar (64 characters)	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.	AltName
	ClientMatterCode	varchar (40 characters)	The client matter code to transmit to Call Manger when any of the phone numbers for this contact are dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call.	ClientMatter-Code
	DirectoryId	lvarchar (2048 characters)	The identifier of this personal contact in a groupware package (for synchronization).	DirectoryId
	DisplayName	nvarchar (64 characters)	The unique text name of the personal contact to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	EmailAddress	lvarchar (320 characters)	The e-mail address (outbound) of the personal contact.	EmailAddress
	FirstName	nvarchar (64 characters)	The first name (i.e., givenName) of a personal contact. Not their surname nor middle name.	Name
	LastName	nvarchar (64 characters)	The last name (i.e., surname or family name) of a personal contact, by which a person is commonly known.	Name
	NickName	nvarchar (64 characters)	The name a user might give for a particular personal contact name that might be hard to pronounce or how they often refer to someone (i.e. Nicholas might be Nick).	Name

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalContact object.	ObjectID
	UserObjectId	char (36 characters)	The unique identifier of the User object to which this personal contact belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalContactCreate	Creates a new PersonalContact object for a user by inserting a new row into tbl_PersonalContact.
csp_PersonalContactDelete	Deletes a PersonalContact object from tbl_PersonalContact as specified by the @ObjectId parameter.
csp_PersonalContactModify	Updates the attributes of a PersonalContact object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalContact object that is updated.

Column Properties

AltFirstName

Property Name	Value
Description:	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.
Notes:	Used to enable name lookup via the VUI client when the primary user firstname contains characters not supported by a speech recognition engine. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable the VUI to search for a user name, an alternate spelling of the user name in ASCII characters can be stored in the altfirstname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.AltFirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltLastName

Property Name	Value
Description:	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.
Notes:	Used to enable name lookup via the VUI client when the primary user lastname contains characters not supported by a speech recognition engine. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable the VUI to search for a user name, an alternate spelling of the user name in ASCII characters can be stored in the altlastname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.AltLastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code to transmit to Call Manger when any of the phone numbers for this contact are dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.ClientMatterCode

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DirectoryId

Property Name	Value
Description:	The identifier of this personal contact in a groupware package (for synchronization).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.DirectoryId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId
SQL Data Type/Length:	lvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of the personal contact to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.

Property Name	Value
Notes:	Users must be allowed to import duplicate contact names. Therefore, there is not a unique constraint on the DisplayName.
Business Rules:	Must allow personal contact to be created with blank DisplayName.
Developer Notes:	To allow import of personal contacts without DisplayName (Exchange does not require a DisplayName), the default value of DisplayName is set to empty string (blank).See CSCsh41143.
Table/Column Mapping:	tbl_PersonalContact.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EmailAddress

Property Name	Value
Description:	The e-mail address (outbound) of the personal contact.
Notes:	The idea is that the email address of the contact could be used to deliver voice messages to the contact - similar to internet subscribers.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.EmailAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	EmailAddress
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FirstName

Property Name	Value
Description:	The first name (i.e., givenName) of a personal contact. Not their surname nor middle name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.FirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastName

Property Name	Value
Description:	The last name (i.e., surname or family name) of a personal contact, by which a person is commonly known.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.LastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

NickName

Property Name	Value
Description:	The name a user might give for a particular personal contact name that might be hard to pronounce or how they often refer to someone (i.e. Nicholas might be Nick).
Notes:	The nickname for a personal contact is recognized when doing speech enabled name dialing or the persons full name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.NickName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalContact object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object to which this personal contact belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.132. vw_PersonalContactPhone

A simple view for tbl_PersonalContactPhone.

A phone number for a personal contact who is not a Cisco Unity Connection user or listed in the corporate directory.

Additional Information

This was kept separate from the tbl_PhoneNumber table purposefully since their use is much different.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DialablePhoneNumber	varchar (255 characters)	Dialable version of the phone number, including any special codes for outside access if needed.	Dialable-PhoneNumber
PK	PersonalContactObjectId	char (36 characters)	The unique identifier of the PersonalContact object to which this phone number belongs.	ObjectID
	PhoneNumber	varchar (255 characters)	The phone number.	PhoneNumber
PK	PhoneType	smallint (2 bytes)	The type of phone to which this number applies. For example: "Home," "Business," "Mobile," etc.	PhoneType
	SearchablePhoneNumber	varchar (255 characters)	Phone number without formatting or any dial codes. A basic form suitable for searching on.	PhoneNumber

Stored Procedures

Name	Description
csp_PersonalContactPhoneCreate	Creates a new PhoneNumber object for a PersonContact by inserting a new row into tbl_PersonalContactPhone.
csp_PersonalContactPhoneDelete	Deletes a PersonalContactPhone object from tbl_PersonalContactPhone as specified by the @PersonalObjectId and @PhoneType parameters.
csp_PersonalContactPhoneModify	Updates the attributes of a PersonalContactPhone object based on the values passed in via the parameters. The @PersonalContactObjectId, @PhoneNumber, and @PhoneType parameters identify the PersonalContactPhone object that is updated.

Column Properties

DialablePhoneNumber

Property Name	Value
Description:	Dialable version of the phone number, including any special codes for outside access if needed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContactPhone.DialablePhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DialablePhoneNumber
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^[0-9Tt#*,]*\$
Validation - Description:	Digit, T, hash, *, or comma.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalContactObjectId

Property Name	Value
Description:	The unique identifier of the PersonalContact object to which this phone number belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContactPhone.PersonalContactObjectId
Primary Key:	True
Allow Null:	False

SearchablePhoneNumber

Property Name	Value
Description:	Phone number without formatting or any dial codes. A basic form suitable for searching on.
Notes:	If PhoneNumber is not specified, the stored procedures will generate SearchablePhoneNumber by stripping out spaces and the following formatting characters: -()#*+.,
Business Rules:	
Developer Notes:	NULL is allowed for upgrade purposes.
Table/Column Mapping:	tbl_PersonalContactPhone.SearchablePhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumber
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^[a-zA-Z0-9 #_\.@,;:\+ \%\'?\'()\~*!&=\\$]*\$
Validation - Description:	For SIP, based on user@server.com portion of the address from http://www.faqs.org/rfcs/rfc3261.html , the character validation rule allows the following characters: All ASCII alphabetical characters (a-z, A-Z) and digits (0-9). Special characters hyphen (-), underscore (_), period (.), exclamation mark (!), tilde (~), asterisk (*), single quote ('), opening and closing parens (()), ampersand (&), equals (=), plus sign (+), dollar sign (\$), colon (:), comma (,), semicolon (;), question mark (?), at sign (@), backslash (\), hash (#), and percent sign (%) are allowed.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	255 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.133. vw_PersonalContactPhoneNumber

A view of personal contact general information including their phone number.

Additional Information

For PA.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AltFirstName	nvarchar (64 characters)	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.	AltName
	AltLastName	nvarchar (64 characters)	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.	AltName
	ClientMatterCode	varchar (40 characters)	The client matter code to transmit to Call Manger when any of the phone numbers for this contact are dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call.	ClientMatter-Code
	DialablePhoneNumber	varchar (255 characters)	Dialable version of the phone number, including any special codes for outside access if needed.	Dialable-PhoneNumber
	DirectoryId	lvarchar (2048 characters)	The identifier of this personal contact in a groupware package (for synchronization).	DirectoryId
	DisplayName	nvarchar (64 characters)	The unique text name of the personal contact to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	EmailAddress	lvarchar (320 characters)	The e-mail address (outbound) of the personal contact.	EmailAddress
	FirstName	nvarchar (64 characters)	The first name (i.e., givenName) of a personal contact. Not their surname nor middle name.	Name
	LastName	nvarchar (64 characters)	The last name (i.e., surname or family name) of a personal contact, by which a person is commonly known.	Name
	NickName	nvarchar (64 characters)	The name a user might give for a particular personal contact name that might be hard to pronounce or how they often refer to someone (i.e. Nicholas might be Nick).	Name
PK	PersonalContactObjectId	char (36 characters)	The unique identifier of the PersonalContact object to which this phone number belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	PhoneNumber	varchar (255 characters)	The phone number.	PhoneNumber
PK	PhoneType	smallint (2 bytes)	The type of phone to which this number applies. For example: "Home," "Business," "Mobile," etc.	PhoneType
	SearchablePhoneNumber	varchar (255 characters)	Phone number without formatting or any dial codes. A basic form suitable for searching on.	PhoneNumber
	UserObjectId	char (36 characters)	The unique identifier of the User object to which this personal contact belongs.	ObjectID

Stored Procedures

vw_PersonalContactPhoneNumber has no stored procedures.

Column Properties

AltFirstName

Property Name	Value
Description:	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.
Notes:	Used to enable name lookup via the VUI client when the primary user firstname contains characters not supported by a speech recognition engine. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable the VUI to search for a user name, an alternate spelling of the user name in ASCII characters can be stored in the altfirstname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.AltFirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltLastName

Property Name	Value
Description:	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for VUI client name lookup.
Notes:	Used to enable name lookup via the VUI client when the primary user lastname contains characters not supported by a speech recognition engine. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable the VUI to search for a user name, an alternate spelling of the user name in ASCII characters can be stored in the altlastname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.AltLastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code to transmit to Call Manger when any of the phone numbers for this contact are dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DialablePhoneNumber

Property Name	Value
Description:	Dialable version of the phone number, including any special codes for outside access if needed.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContactPhone.DialablePhoneNumber
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DialablePhoneNumber
SQL Data Type/Length:	varchar (255 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digit, T, hash, *, or comma.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DirectoryId

Property Name	Value
Description:	The identifier of this personal contact in a groupware package (for synchronization).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.DirectoryId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId

Property Name	Value
SQL Data Type/Length:	lvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of the personal contact to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	Users must be allowed to import duplicate contact names. Therefore, there is not a unique constraint on the DisplayName.
Business Rules:	Must allow personal contact to be created with blank DisplayName.
Developer Notes:	To allow import of personal contacts without DisplayName (Exchange does not require a DisplayName), the default value of DisplayName is set to empty string (blank). See CSCsh41143.
Table/Column Mapping:	tbl_PersonalContact.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EmailAddress

Property Name	Value
Description:	The e-mail address (outbound) of the personal contact.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_PersonalContact.EmailAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	EmailAddress

5.134. vw_PersonalDestination

A simple view for tbl_PersonalDestination.

A personal device for any Cisco Unity Connection subscriber at which a subscriber can be reached after applying personal call routing rules. For example, a subscriber's home phone, cell phone or pager can be a personal destination.

Additional Information

These "one-off" destinations are used for subscriber personal call routing rules.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallPickupTimeout	int (4 bytes)	The number of rings that Cisco Unity Connection will wait for a subscriber destination to answer before the call is forwarded to the next destination in the destination group.	
	DetectTransferLoop	smallint (2 bytes)	A flag indicating whether Unity can do a loop detect transfer to this device.	Bool
	Name	nvarchar (64 characters)	The unique text name of the personal destination to be used when displaying entries for administrative purposes such as in Cisco Personal Communications Assistant.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalDestination object.	ObjectID
	PhoneNumber	nvarchar (40 characters)	The phone number of the destination.	PhoneNumberE123
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this destination belongs.	ObjectID
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should transmit a Forced Authorization Code (FAC) to Cisco Unified Communications Manager after this number is dialed during an outbound call.	Bool

Stored Procedures

Name	Description
csp_PersonalDestinationCreate	Creates a new PersonalDestination object for a user by inserting a new row into tbl_PersonalDestination.
csp_PersonalDestinationDelete	Deletes a PersonalDestination object from tbl_PersonalDestination as specified by the @ObjectId parameter.

Name	Description
csp_PersonalDestinationModify	Updates the attributes of a PersonalDestination object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalDestination object that is updated.

Column Properties

CallPickupTimeout

Property Name	Value
Description:	The number of rings that Cisco Unity Connection will wait for a subscriber destination to answer before the call is forwarded to the next destination in the destination group.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestination.CallPickupTimeout

Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	100

DetectTransferLoop

Property Name	Value
Description:	A flag indicating whether Unity can do a loop detect transfer to this device.
Notes:	Values 0: Loop detect transfers to this device are NOTallowed 1: Loop detect transfers are allowed to this device
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestination.DetectTransferLoop

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Name

Property Name	Value
Description:	The unique text name of the personal destination to be used when displaying entries for administrative purposes such as in Cisco Personal Communications Assistant.
Notes:	The text name of a personal destination must be unique for a subscriber.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestination.Name
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalDestination object.

Property Name	Value
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestination.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:

5.135. vw_PersonalDestinationGroup

A simple view for tbl_PersonalDestinationGroup.

A group of personal destinations. Personal destinations can be grouped into one or more personal destination groups. A call can be routed to a personal destination group and thereby a call can be transferred to any of the destinations included in that group.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Name	nvarchar (64 characters)	The unique text name of the personal destination group to be used when displaying entries for administrative purposes such as in Cisco Personal Communications Assistant.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalDestinationGroup object.	ObjectID
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this personal destination group belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalDestinationGroupCreate	Creates a new PersonalDestinationGroup object for a user by inserting a new row into tbl_PersonalDestinationGroup.
csp_PersonalDestinationGroupDelete	Deletes a PersonalDestinationGroup object from tbl_PersonalDestinationGroup as specified by the @ObjectId parameter.
csp_PersonalDestinationGroupModify	Updates the attributes of a PersonalDestinationGroup object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalDestinationGroup object that is updated.

Column Properties

Name

Property Name	Value
Description:	The unique text name of the personal destination group to be used when displaying entries for administrative purposes such as in Cisco Personal Communications Assistant.
Notes:	The name must be unique for a subscriber.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestinationGroup.Name

5.136. vw_PersonalDestinationGroupItem

A simple view for tbl_PersonalDestinationGroupItem.

A destination that is a member of a PersonalDestinationGroup.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DestDtmfAccessIdObjectId	char (36 characters)	The destination for this personal rule. If the destination is a DtmfAccessId, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId. Otherwise, this attribute is set to NULL.	ObjectID
	DestNotificationDeviceObjectId	char (36 characters)	The destination for this personal rule. If the destination is a notification device, the unique identifier of the corresponding NotificationDevice object in tbl_NotificationDevice. Otherwise, this attribute is set to NULL.	ObjectID
	DestPersonalDestinationObjectId	char (36 characters)	The destination for this personal rule. If the destination is another personal destination object, the unique identifier of the corresponding PersonalDestination object in tbl_PersonalDestination. Otherwise, this attribute is set to NULL.	ObjectID
	DestPhoneNumberObjectId	char (36 characters)	The destination for this personal rule. If the destination is a phone number, the unique identifier of the corresponding PhoneNumber object in tbl_PhoneNumber. Otherwise, this attribute is set to NULL.	ObjectID
	ItemIndex	smallint (2 bytes)	The order in which the destinations in a group will be used. The order is from the lowest number to the highest.	
PK	ObjectId	char (36 characters)	The surrogate key for this table. A globally unique, system-generated identifier for a PersonalDestinationGroupItem object.	ObjectID
	PersonalDestinationGroupObjectId	char (36 characters)	The unique identifier of the PersonalDestinationGroup to which this member belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalDestinationGroupItemCreate	Creates a new PersonalDestinationGroupItem object by inserting a new row into tbl_PersonalDestinationGroupItem.
csp_PersonalDestinationGroupItemDelete	Deletes a PersonalDestinationGroupItem object from tbl_PersonalDestinationGroupItem as specified by the @ObjectId parameter.
csp_PersonalDestinationGroupItemModify	Updates the attributes of a PersonalDestinationGroupItem object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalDestinationGroupItem object that is updated.

Column Properties

DestDtmfAccessIdObjectId

Property Name	Value
Description:	The destination for this personal rule. If the destination is a DtmfAccessId, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId. Otherwise, this attribute is set to NULL.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal destination group member must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalDestinationGroupItem.DestDtmfAccessIdObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL

5.138. vw_PersonalGroup

A view of tbl_PersonalGroup.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	DisplayName	nvarchar (64 characters)	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfName	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the group name. These digits would need to be dialed to address a message to this group via the phone.	DtmfName
	IsVoiceMailList	smallint (2 bytes)	A flag indicating whether this a voice mail distribution list.	Bool
	NumericId	nvarchar (4 characters)	NumericId, used for PDLs	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.	ObjectID
	UserObjectId	char (36 characters)	The unique identifier of the User object to which this group belongs.	ObjectID
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_PersonalGroupCreate	Creates a new PersonalGroup object for a user by inserting a new row into tbl_PersonalGroup. A PersonalGroup can contain users, personal contacts, other personal groups, and even distribution lists. To create a "personal voicemail list," use csp_PersonalVoiceMailListCreate.
csp_PersonalGroupDelete	Deletes a PersonalGroup object from tbl_PersonalGroup as specified by the @ObjectId parameter.

Name	Description
csp_PersonalGroupModify	Updates the attributes of a PersonalGroup object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalGroup object that is updated.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	
Developer Notes:	The displayname must be unique within a type (CallerGroup and PersonalVoiceMailList) for a given subscriber.
Table/Column Mapping:	tbl_PersonalGroup.DisplayName

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the group name. These digits would need to be dialed to address a message to this group via the phone.
Notes:	
Business Rules:	When the display name of a group is changed in this table, the value of the DtmfName column is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.DtmfName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsVoiceMailList

Property Name	Value
Description:	A flag indicating whether this a voice mail distribution list.
Notes:	Voice mail distribution lists are restricted to addressable entities to avoid or reduce NDR problems. Values: 0: This personal group is not a voice mail distribution list. 1: This personal group is a voice mail distribution list.
Business Rules:	
Developer Notes:	This flag also determines where in the UI this list is managed, since PersonalGroups are used without this for setting up caller rules, it allows the UI to present a simplified list of voice mail distribution lists for a subscriber.
Table/Column Mapping:	tbl_PersonalGroup.IsVoiceMailList
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NumericId

Property Name	Value
Description:	NumericId, used for PDLs
Notes:	From conversations, the "personal voicemail lists" are referenced by number, so this is essentially an index.
Business Rules:	
Developer Notes:	NULL is allowed so this can also be used as a caller group (not personal voicemail list).
Table/Column Mapping:	tbl_PersonalGroup.NumericId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (4 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Digits only.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	4 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object to which this group belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.139. vw_PersonalGroupMember

A simple view for tbl_PersonalGroupMember.

A member of a personal group. A member can be a user, personal contact, distribution list, or another personal group.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	MemberContactObjectId	char (36 characters)	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberDistributionListObjectId	char (36 characters)	The member of this personal group. If the member is a distribution list, the unique identifier of the corresponding DistributionList object in tbl_DistributionList. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberPersonalContactObjectId	char (36 characters)	The member of this personal group. If the member is a personal contact, the unique identifier of the corresponding PersonalContact object in tbl_PersonalContact. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberPersonalGroupObjectId	char (36 characters)	The member of this personal group. If the member is another personal group, the unique identifier of the corresponding PersonalGroup object in tbl_PersonalGroup. Otherwise, this attribute is set ot NULL.	ObjectID
	MemberUserObjectId	char (36 characters)	The member of this personal group. If the member is a user, the unique identifier of the corresponding User object in tbl_User. Otherwise, this attribute is set ot NULL.	ObjectID
PK	ObjectId	char (36 characters)	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.	ObjectID
	PersonalGroupObjectId	char (36 characters)	The unique identifier of the PersonalGroup object to which this member belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalGroupMemberCreate	Adds a new member (user, personal contact, distribution list, or another personal group) by inserting a new row into tbl_PersonalGroupMember.
csp_PersonalGroupMemberDelete	Deletes a PersonalGroupMember object from tbl_PersonalGroupMember as specified by the @ObjectId parameter.

Column Properties

MemberContactObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:

5.140. vw_PersonalGroupMemberDetail

A view for tbl_PersonalGroupMember and associated Alias.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	MemberContactObjectId	char (36 characters)	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set to NULL.	ObjectID
	MemberDistributionListObjectId	char (36 characters)	The member of this personal group. If the member is a distribution list, the unique identifier of the corresponding DistributionList object in tbl_DistributionList. Otherwise, this attribute is set to NULL.	ObjectID
	MemberObjectType	smallint (2 bytes)	Object type of member	ObjectType
	MemberPersonalContactObjectId	char (36 characters)	The member of this personal group. If the member is a personal contact, the unique identifier of the corresponding PersonalContact object in tbl_PersonalContact. Otherwise, this attribute is set to NULL.	ObjectID
	MemberPersonalGroupObjectId	char (36 characters)	The member of this personal group. If the member is another personal group, the unique identifier of the corresponding PersonalGroup object in tbl_PersonalGroup. Otherwise, this attribute is set to NULL.	ObjectID
	MemberUserObjectId	char (36 characters)	The member of this personal group. If the member is a user, the unique identifier of the corresponding User object in tbl_User. Otherwise, this attribute is set to NULL.	ObjectID
PK	ObjectId	char (36 characters)	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.	ObjectID
	PersonalGroupAlias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	PersonalGroupDisplayName	nvarchar (64 characters)	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	PersonalGroupObjectId	char (36 characters)	The unique identifier of the PersonalGroup object to which this member belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	UserObjectId	char (36 characters)	The unique identifier of the User object to which this group belongs.	ObjectID

Column Properties

MemberContactObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberDistributionListObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a distribution list, the unique identifier of the corresponding DistributionList object in tbl_DistributionList. Otherwise, this attribute is set ot NULL.

Property Name	Value
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberDistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId

SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Property Name	Value
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalGroupAlias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalGroupDisplayName

Property Name	Value
Description:	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	The displayname must be unique within a type (CallerGroup and PersonalVoiceMailList) for a given subscriber.
Table/Column Mapping:	tbl_PersonalGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalGroupObjectId

Property Name	Value
Description:	The unique identifier of the PersonalGroup object to which this member belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.PersonalGroupId
Primary Key:	False
Allow Null:	False
Default Value:

SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object to which this group belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.141. vw_PersonalRule

A simple view for tbl_PersonalRule.

A call routing rule this is applied for a subscriber after Cisco Unity Connection answers the call. Commonly referred to as the "personal call routing rules" feature.

Additional Information

A PersonalRule works by using ANI or CallerID to help identify the incoming caller, and then based on who is calling the rule may specify what to do with the call. The rule specifies a series of phone numbers or devices to try in order using what is called a destination. This destination may be one of several things: the subscriber's extension, an existing NotificationDevice for the subscriber (so that we can take advantage of a Subscriber's pager or SMS device), another subscriber, one of a subscriber's phone numbers (as defined here: PhoneNumber), or a one-off phone number (PersonalDestination).

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AlwaysTriggerPage	smallint (2 bytes)	A flag indicating whether the rule should always trigger a pager notification device associated with this rule.	Bool
	ClientMatterCode	varchar (40 characters)	The client matter code (CMC) to transmit to Cisco Unified Communications Manager when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign accounting or billing codes to the call.	ClientMatter-Code
	DestCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object used to route the call.	ObjectID
	DestDtmfAccessId-ObjectId	char (36 characters)	The destination (DtmfAccessId) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId.	ObjectID
	DestNotificationDeviceObjectId	char (36 characters)	The destination (NotificationDevice) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding NotificationDevice object in tbl_NotificationDevice.	ObjectID
	DestPersonalDestination-GroupObjectId	char (36 characters)	The destination (PersonalDestinationGroup) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestinationGroup object in tbl_PersonalDestinationGroup.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	DestPersonalDestinationObjectId	char (36 characters)	The destination (PersonalDestination) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestination object in tbl_PersonalDestination.	ObjectID
	DestPhoneNumberObjectId	char (36 characters)	The destination (PhoneNumber) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PhoneNumber object in tbl_PhoneNumber.	ObjectID
	InMeeting	smallint (2 bytes)	A flag indicating whether the rule is triggered depending on whether the subscriber is in a meeting or not.	RuleMeeting-Condition
	IsInclusive	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should AND or OR the different types of rules defined in tbl_PersonalRuleCaller for a subscriber.	RuleCallerInclusiveCondition
	IsInternal	smallint (2 bytes)	A flag indicating whether the rule should trigger based on whether the caller is internal or external.	RuleCallerInternalCondition
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalRule object.	ObjectID
	PersonalRuleSetObjectId	char (36 characters)	The unique identifier of the PersonalRuleSet object to which this personal rule belongs.	ObjectID
	RingAllDestinationsAtOnce	smallint (2 bytes)	A flag indicating whether all rule destinations should be dialed simultaneously or sequentially.	Bool
	RuleIndex	smallint (2 bytes)	The order in which rules within a rule set are executed.	
	ScreenCall	smallint (2 bytes)	A flag indicating whether the incoming call should be screened.	Bool
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this rule belongs.	ObjectID
	TimeRangeEnd	int (4 bytes)	The end time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.	
	TimeRangeIndicatesActiveHours	int (4 bytes)	The definition for how a time range should be utilized.	PersonalRule-TimeRange-Type
	TimeRangeStart	int (4 bytes)	The start time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.	

Stored Procedures

Name	Description
csp_PersonalRuleCreate	Creates a new PersonalRule object for a subscriber by inserting a new row into tbl_PersonalRule.
csp_PersonalRuleDelete	Deletes a PersonalRule object from tbl_PersonalRule as specified by the @ObjectId parameter.
csp_PersonalRuleModify	Updates the attributes of a PersonalRule object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalRule object that is updated.

Column Properties

AlwaysTriggerPage

Property Name	Value
Description:	A flag indicating whether the rule should always trigger a pager notification device associated with this rule.
Notes:	Values: 0: Do not trigger a pager notification device 1: Trigger a pager notification device
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.AlwaysTriggerPage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code (CMC) to transmit to Cisco Unified Communications Manager when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign accounting or billing codes to the call.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object used to route the call.
Notes:	This is normally used to route to voice mail using a system level call action object. Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestCallActionObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

DestDtmfAccessIdObjectId

Property Name	Value
Description:	The destination (DtmfAccessId) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestDtmfAccessIdObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestNotificationDeviceObjectId

Property Name	Value
Description:	The destination (NotificationDevice) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding NotificationDevice object in tbl_NotificationDevice.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestNotificationDeviceObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestPersonalDestinationGroupObjectID

Property Name	Value
Description:	The destination (PersonalDestinationGroup) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestinationGroup object in tbl_PersonalDestinationGroup.
Notes:	Only one Dest*ObjectID column should contain a non-null value. All other Dest*ObjectID columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPersonalDestinationGroupObjectID
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestPersonalDestinationObjectID

Property Name	Value
Description:	The destination (PersonalDestination) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestination object in tbl_PersonalDestination.

Property Name	Value
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPersonalDestinationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestPhoneNumberObjectId

Property Name	Value
Description:	The destination (PhoneNumber) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PhoneNumber object in tbl_PhoneNumber.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPhoneNumberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

InMeeting

Property Name	Value
Description:	A flag indicating whether the rule is triggered depending on whether the subscriber is in a meeting or not.
Notes:	Values: 0: Not set - meeting condition is not applicable. 1: Not in meeting. 2: In meeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.InMeeting
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleMeetingCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsInclusive

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should AND or OR the different types of rules defined in tbl_PersonalRuleCaller for a subscriber.
Notes:	Values: 0: Caller condition not inclusive 1: Inclusive only from caller. 2: Inclusive only when not from caller.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.IsInclusive
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleCallerInclusiveCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsInternal

Property Name	Value
Description:	A flag indicating whether the rule should trigger based on whether the caller is internal or external.
Notes:	Values: 0: Not set - caller condition is not applicable. 1: Internal condition. 2: External condition.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.IsInternal
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleCallerInternalCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalRule object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ObjectId

Property Name	Value
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalRuleSetObjectId

Property Name	Value
Description:	The unique identifier of the PersonalRuleSet object to which this personal rule belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.PersonalRuleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RingAllDestinationsAtOnce

Property Name	Value
Description:	A flag indicating whether all rule destinations should be dialed simultaneously or sequentially.

Property Name	Value
Notes:	Values: 0: Ring destinations in sequential order 1: Ring all destinations at once
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.RingAllDestinationsAtOnce
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RuleIndex

Property Name	Value
Description:	The order in which rules within a rule set are executed.
Notes:	The lowest value is the highest priority - a value of 0 is the highest possible priority.
Business Rules:	* The lowest value is the highest priority. * A RuleIndex must be unique for all rules within a personal rule set.
Developer Notes:	No default value - required parameter.
Table/Column Mapping:	tbl_PersonalRule.RuleIndex
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ScreenCall

Property Name	Value
Description:	A flag indicating whether the incoming call should be screened.
Notes:	Values: 0: Do not screen the incoming call 1: Call screening shall be performed on the incoming call
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ScreenCall
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this rule belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

TimeRangeEnd

Property Name	Value
Description:	The end time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.
Notes:	The value of TimeRange{Start End} is a number from 0 to 2359 representing hours (hundreds) and minutes (0-59) of the hour. For example, 2:23pm is represented by 1423 and is the summation of the 0-24 hours in hundred (2pm == 1400) and the number of minutes in the hour (23).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.TimeRangeEnd
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeRangeIndicatesActiveHours

Property Name	Value
Description:	The definition for how a time range should be utilized.
Notes:	Values: 0: Not included - time range not included. 1: Between - time range between which rule is active. 2: Not between - time range not between which rule is active
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.TimeRangeIndicatesActiveHours
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	PersonalRuleTimeRangeType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeRangeStart

Property Name	Value
Description:	The start time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.
Notes:	The value of TimeRange{Start End} is a number from 0 to 2359 representing hours (hundreds) and minutes (0-59) of the hour. For example, 2:23pm is represented by 1423 and is the summation of the 0-24 hours in hundred (2pm == 1400) and the number of minutes in the hour (23).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.TimeRangeStart

5.142. vw_PersonalRuleCaller

A simple view for tbl_PersonalRuleCaller.

A personal rule caller is a caller that drives a personal rule. A caller can be a phone number (CallerANI), a contact, a personal contact, a personal group or user.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallerANI	nvarchar (40 characters)	The phone number of the caller (i.e., Caller ID) for callers that don't already exist elsewhere in the Cisco Unity Connection database.	
	CallerContactObjectId	char (36 characters)	The unique identifier of a Contact object.	ObjectID
	CallerPersonalContactObjectId	char (36 characters)	The unique identifier of the a PersonalContact object.	ObjectID
	CallerPersonalGroupObjectId	char (36 characters)	The unique identifier of a PersonalGroup object	ObjectID
	CallerUserObjectId	char (36 characters)	The unique identifier of a User object.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalRuleCaller object.	ObjectID
	PersonalRuleObjectId	char (36 characters)	The unique identifier of the PersonalRule object associated with this caller.	ObjectID
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this personal rule caller belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalRuleCallerCreate	Creates a new PersonalRuleCaller object for a subscriber by inserting a new row into tbl_PersonalRuleCaller.
csp_PersonalRuleCallerDelete	Deletes a PersonalRuleCaller object from tbl_PersonalRuleCaller as specified by the @ObjectId parameter.
csp_PersonalRuleCallerModify	Updates the CallerANI property of a PersonalRuleCaller object based on the value passed in via the parameters. The @ObjectId parameter identifies the PersonalRuleCaller object that is updated.

Column Properties

CallerANI

Property Name	Value
Description:	The phone number of the caller (i.e., Caller ID) for callers that don't already exist elsewhere in the Cisco Unity Connection database.
Notes:	The CallerANI column in tbl_PersonalRuleCaller is actually a "pattern", and must allow wildcards. Currently the PRD calls for the asterisk (*) and single-digit (x or X). The rules engine will support the range wildcard. Ex: [14-6] stands for one occurrence of 1, 4, 5, or 6.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.CallerANI
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@*\#[\]\(\)]*\$
Validation - Description:	Alphanumeric or one of these: -_.*#[\]\(\),()
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallerContactObjectId

Property Name	Value
Description:	The unique identifier of a Contact object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.CallerContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallerPersonalContactObjectId

Property Name	Value
Description:	The unique identifier of the a PersonalContact object.
Notes:	
Business Rules:	The personal contact must belong to the subscriber.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.CallerPersonalContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallerPersonalGroupObjectId

Property Name	Value
Description:	The unique identifier of a PersonalGroup object
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.CallerPersonalGroupObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallerUserObjectId

Property Name	Value
Description:	The unique identifier of a User object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.CallerUserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalRuleCaller object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.ObjectId
Primary Key:	True

Property Name	Value
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalRuleObjectID

Property Name	Value
Description:	The unique identifier of the PersonalRule object associated with this caller.
Notes:	
Business Rules:	The rule must belong to the subscriber.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.PersonalRuleObjectID
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectID

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this personal rule caller belongs.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleCaller.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectId

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.143. vw_PersonalRuleDetail

A view for tbl_PersonalRule with a few columns from tbl_PersonalRuleSet.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AlwaysTriggerPage	smallint (2 bytes)	A flag indicating whether the rule should always trigger a pager notification device associated with this rule.	Bool
	ClientMatterCode	varchar (40 characters)	The client matter code (CMC) to transmit to Cisco Unified Communications Manager when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign accounting or billing codes to the call.	ClientMatter-Code
	DestCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object used to route the call.	ObjectID
	DestDtmfAccessIdObjectId	char (36 characters)	The destination (DtmfAccessId) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId.	ObjectID
	DestNotificationDeviceObjectId	char (36 characters)	The destination (NotificationDevice) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding NotificationDevice object in tbl_NotificationDevice.	ObjectID
	DestPersonalDestinationGroupObjectId	char (36 characters)	The destination (PersonalDestinationGroup) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestinationGroup object in tbl_PersonalDestinationGroup.	ObjectID
	DestPersonalDestinationObjectId	char (36 characters)	The destination (PersonalDestination) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestination object in tbl_PersonalDestination.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	DestPhoneNumberObjectId	char (36 characters)	The destination (PhoneNumber) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PhoneNumber object in tbl_PhoneNumber.	ObjectID
	InMeeting	smallint (2 bytes)	A flag indicating whether the rule is triggered depending on whether the subscriber is in a meeting or not.	RuleMeeting-Condition
	IsEnabled	smallint (2 bytes)	A flag indicating whether this rule set is enabled.	Bool
	IsInclusive	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should AND or OR the different types of rules defined in tbl_PersonalRuleCaller for a subscriber.	RuleCallerInclusiveCondition
	IsInternal	smallint (2 bytes)	A flag indicating whether the rule should trigger based on whether the caller is internal or external.	RuleCallerInternalCondition
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalRule object.	ObjectID
	PersonalRuleSetName	nvarchar (64 characters)	The unique text name of the personal rule set to be used when displaying entries in Cisco Personal Communications Assistant.	DisplayName
	PersonalRuleSetObjectId	char (36 characters)	The unique identifier of the PersonalRuleSet object to which this personal rule belongs.	ObjectID
	RingAllDestinationsAtOnce	smallint (2 bytes)	A flag indicating whether all rule destinations should be dialed simultaneously or sequentially.	Bool
	RuleIndex	smallint (2 bytes)	The order in which rules within a rule set are executed.	
	ScheduleSetObjectId	char (36 characters)	The unique identifier of the ScheduleSet object that indicates the operational hours for this rule set. (If the personal rule set is operational for a particular time period.)	ObjectID
	ScreenCall	smallint (2 bytes)	A flag indicating whether the incoming call should be screened.	Bool
	SubscriberObjectId	char (36 characters)	The unique identifier of the Subscriber object to which this rule belongs.	ObjectID
	TimeRangeEnd	int (4 bytes)	The end time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.	
	TimeRangeIndicatesActiveHours	int (4 bytes)	The definition for how a time range should be utilized.	PersonalRule-TimeRange-Type
	TimeRangeStart	int (4 bytes)	The start time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.	

Stored Procedures

Name	Description
csp_PersonalRuleCreate	Creates a new PersonalRule object for a subscriber by inserting a new row into tbl_PersonalRule.
csp_PersonalRuleDelete	Deletes a PersonalRule object from tbl_PersonalRule as specified by the @ObjectId parameter.
csp_PersonalRuleModify	Updates the attributes of a PersonalRule object based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalRule object that is updated.

Column Properties

AlwaysTriggerPage

Property Name	Value
Description:	A flag indicating whether the rule should always trigger a pager notification device associated with this rule.
Notes:	Values: 0: Do not trigger a pager notification device 1: Trigger a pager notification device
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.AlwaysTriggerPage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code (CMC) to transmit to Cisco Unified Communications Manager when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assign accounting or billing codes to the call.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object used to route the call.
Notes:	This is normally used to route to voice mail using a system level call action object. Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestCallActionObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

DestDtmfAccessIdObjectId

Property Name	Value
Description:	The destination (DtmfAccessId) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding DtmfAccessId object in tbl_DtmfAccessId.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestDtmfAccessIdObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestNotificationDeviceObjectId

Property Name	Value
Description:	The destination (NotificationDevice) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding NotificationDevice object in tbl_NotificationDevice.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestNotificationDeviceObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestPersonalDestinationGroupObjectID

Property Name	Value
Description:	The destination (PersonalDestinationGroup) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestinationGroup object in tbl_PersonalDestinationGroup.
Notes:	Only one Dest*ObjectID column should contain a non-null value. All other Dest*ObjectID columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPersonalDestinationGroupObjectID
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DestPersonalDestinationObjectID

Property Name	Value
Description:	The destination (PersonalDestination) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PersonalDestination object in tbl_PersonalDestination.

Property Name	Value
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPersonalDestinationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Validation - Maximum Value:	

DestPhoneNumberObjectId

Property Name	Value
Description:	The destination (PhoneNumber) to which Cisco Unity Connection should route an incoming call to the subscriber. Specifically, the unique identifier of the corresponding PhoneNumber object in tbl_PhoneNumber.
Notes:	Only one Dest*ObjectId column should contain a non-null value. All other Dest*ObjectId columns should contain NULL.
Business Rules:	A personal rule must have a destination and can have only one destination.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.DestPhoneNumberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

InMeeting

Property Name	Value
Description:	A flag indicating whether the rule is triggered depending on whether the subscriber is in a meeting or not.
Notes:	Values: 0: Not set - meeting condition is not applicable. 1: Not in meeting. 2: In meeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.InMeeting
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleMeetingCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsEnabled

Property Name	Value
Description:	A flag indicating whether this rule set is enabled.
Notes:	By default, all rule sets are enabled.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleSet.IsEnabled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

IsInclusive

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should AND or OR the different types of rules defined in tbl_PersonalRuleCaller for a subscriber.
Notes:	Values: 0: Caller condition not inclusive 1: Inclusive only from caller. 2: Inclusive only when not from caller.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.IsInclusive
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleCallerInclusiveCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsInternal

Property Name	Value
Description:	A flag indicating whether the rule should trigger based on whether the caller is internal or external.
Notes:	Values: 0: Not set - caller condition is not applicable. 1: Internal condition. 2: External condition.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.IsInternal
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	RuleCallerInternalCondition
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalRule object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalRuleSetName

Property Name	Value
Description:	The unique text name of the personal rule set to be used when displaying entries in Cisco Personal Communications Assistant.
Notes:	The name of a personal rule set must be unique for a subscriber.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleSet.Name
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PersonalRuleSetObjectId

Property Name	Value
Description:	The unique identifier of the PersonalRuleSet object to which this personal rule belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.PersonalRuleSetObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RingAllDestinationsAtOnce

Property Name	Value
Description:	A flag indicating whether all rule destinations should be dialed simultaneously or sequentially.
Notes:	Values: 0: Ring destinations in sequential order 1: Ring all destinations at once
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.RingAllDestinationsAtOnce
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RuleIndex

Property Name	Value
Description:	The order in which rules within a rule set are executed.
Notes:	The lowest value is the highest priority - a value of 0 is the highest possible priority.
Business Rules:	* The lowest value is the highest priority. * A RuleIndex must be unique for all rules within a personal rule set.
Developer Notes:	No default value - required parameter.
Table/Column Mapping:	tbl_PersonalRule.RuleIndex
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the ScheduleSet object that indicates the operational hours for this rule set. (If the personal rule set is operational for a particular time period.)
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRuleSet.ScheduleSetObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ScreenCall

Property Name	Value
Description:	A flag indicating whether the incoming call should be screened.
Notes:	Values: 0: Do not screen the incoming call 1: Call screening shall be performed on the incoming call
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.ScreenCall
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the Subscriber object to which this rule belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.SubscriberObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeRangeEnd

Property Name	Value
Description:	The end time for the time range in which this rule is either enabled or disabled, depending on the value of TimeRangeIndicatedActiveHours.
Notes:	The value of TimeRange{Start End} is a number from 0 to 2359 representing hours (hundreds) and minutes (0-59) of the hour. For example, 2:23pm is represented by 1423 and is the summation of the 0-24 hours in hundred (2pm == 1400) and the number of minutes in the hour (23).
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalRule.TimeRangeEnd
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Validation - Maximum Value:	

5.145. vw_PersonalVoiceMailList

A view of tbl_PersonalGroup that is flagged as a personal voice mail list. In the UI this is referred to as a "Private List." Similar to Private Distribution Lists in Unity 4.0(x), this type of group contains only addressable entities such as other Unity Connection subscribers or contacts.

Additional Information

The Personal Voicemail List (PVL) will only allow Cisco Unity Connection subscribers to be added, and is available through the TUI and CPCA for sending messages.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	DisplayName	nvarchar (64 characters)	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfName	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the group name. These digits would need to be dialed to address a message to this group via the phone.	DtmfName
	NumericId	nvarchar (4 characters)	If being used as a personal voicemail list (i.e., "private" voicemail list), the numeric identifier for the personal group,	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.	ObjectID
	UserObjectId	char (36 characters)	The unique identifier of the User object to which this group belongs.	ObjectID
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid

Stored Procedures

Name	Description
csp_PersonalVoiceMailListCreate	Creates a new personal voicemail list for a user by inserting a new row into tbl_PersonalGroup. A "personal voicemail list" is a personal group that contains only Cisco Unity Connection subscribers ("IsVoiceMailList" == 1). It is used for addressing messages, either via the TUI or CPCA.

Name	Description
csp_PersonalVoiceMailListDelete	Deletes a PersonalGroup object from tbl_PersonalGroup as specified by the @ObjectId parameter.
csp_PersonalVoiceMailListModify	Updates the attributes of a personal voicemail list (PersonalGroup object) based on the values passed in via the parameters. The @ObjectId parameter identifies the PersonalGroup object that is updated.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of the group to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	The displayname must be unique within a type (CallerGroup and PersonalVoiceMailList) for a given subscriber.
Table/Column Mapping:	tbl_PersonalGroup.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfName

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the group name. These digits would need to be dialed to address a message to this group via the phone.
Notes:	
Business Rules:	When the display name of a group is changed in this table, the value of the DtmfName column is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.DtmfName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

NumericId

Property Name	Value
Description:	If being used as a personal voicemail list (i.e., "private" voicemail list), the numeric identifier for the personal group,
Notes:	From conversations, the "personal voicemail lists" are referenced by number, so this is essentially an index.
Business Rules:	
Developer Notes:	NULL is allowed so this can also be used as a caller group (not personal voicemail list).
Table/Column Mapping:	tbl_PersonalGroup.NumericId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (4 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Digits only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	4 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a PersonalGroup object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object to which this group belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroup.UserId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.146. vw_PersonalVoiceMailListMember

Contains the members of a personal voicemail list. Members can be either a subscriber, a system distribution list or another personal voicemail list.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	MemberContactObjectId	char (36 characters)	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set to NULL.	ObjectID
	MemberDistributionListObjectId	char (36 characters)	The member of this personal group. If the member is a distribution list, the unique identifier of the corresponding DistributionList object in tbl_DistributionList. Otherwise, this attribute is set to NULL.	ObjectID
	MemberPersonalVoiceMailListObjectId	char (36 characters)	The member of this personal group. If the member is another personal group, the unique identifier of the corresponding PersonalGroup object in tbl_PersonalGroup. Otherwise, this attribute is set to NULL.	ObjectID
	MemberSubscriberObjectId	char (36 characters)	The member of this personal group. If the member is a user, the unique identifier of the corresponding User object in tbl_User. Otherwise, this attribute is set to NULL.	ObjectID
PK	ObjectId	char (36 characters)	Surrogate key. A globally unique, system-generated identifier for a PersonalGroupMember object.	ObjectID
	PersonalVoiceMailListObjectId	char (36 characters)	The unique identifier of the PersonalGroup object to which this member belongs.	ObjectID

Stored Procedures

Name	Description
csp_PersonalVoiceMailListMemberCreate	Adds a member (subscriber, distribution list, or another personal voicemail list) to a personal voicemail list by inserting a new row into tbl_PersonalGroupMember.
csp_PersonalVoiceMailListMemberDelete	Deletes a personal voicemail list member (PersonalGroupMember object) specified by the @ObjectId parameter from tbl_PersonalGroupMember.

Column Properties

MemberContactObjectId

Property Name	Value
Description:	The member of this personal group. If the member is a system contact, the unique identifier of the corresponding Contact object in tbl_Contact. Otherwise, this attribute is set ot NULL.
Notes:	Only one Member*ObjectId column should contain a non-null value. All other Member*ObjectId columns should contain NULL.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PersonalGroupMember.MemberContactObjectId
Primary Key:	False
Allow Null:	True

5.148. vw_PhoneNumber

A simple view for tbl_PhoneNumber.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AutoLogon	smallint (2 bytes)	A flag indicating whether the phone number can be used for automatically logging on the caller.	Bool
	CallPickupTimeout	smallint (2 bytes)	The number of rings that Cisco Unity Connection will wait for a subscriber destination to answer before the call is forwarded to the next destination in the destination group.	
	ClientMatterCode	varchar (40 characters)	The client matter code to transmit to Call Manger when the phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call.	ClientMatter-Code
	DialablePhoneNumber	varchar (255 characters)	A dialable version of the PhoneNumber column.	Dialable-PhoneNumber
	DisplayName	nvarchar (64 characters)	The preferred text name of the phone number to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a PhoneNumber object.	ObjectID
	Owner_ContactObjectId	char (36 characters)	The object to which this phone number belongs. If the phone number belongs to a Contact, the unique identifier of the Contact object to which this phone number belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_UserObjectId	char (36 characters)	The object to which this phone number belongs. If the phone number belongs to a User, the unique identifier of the User object to which this phone number belongs. Otherwise, this attribute is set to NULL.	ObjectID
	PhoneNumber	varchar (255 characters)	A phone number.	PhoneNumber
	PhoneType	smallint (2 bytes)	A well-defined name for the phone number, such as "Home," "Business," "Mobile," etc.	PhoneType
	SearchablePhoneNumber	varchar (255 characters)	Phone number without formatting or any dial codes. A basic form suitable for searching on.	PhoneNumber

Key	Name	SQL Data Type/Length	Description	Custom Type
	TransmitForcedAuthorizationCode	smallint (2 bytes)	A flag indicating whether an authorization code should be transmitted to Call Manager after this number is dialed during an outbound call.	Bool

Stored Procedures

Name	Description
csp_PhoneNumberCreate	Creates a new PhoneNumber object for a user such as "Home Phone" by inserting a new row into tbl_PhoneNumber.
csp_PhoneNumberDelete	Deletes a PhoneNumber object from tbl_PhoneNumber as specified by the @ObjectId parameter.
csp_PhoneNumberModify	Updates the attributes of a PhoneNumber object based on the values passed in via the parameters. The @ObjectId parameter identifies the PhoneNumber object that is updated.

Column Properties

AutoLogon

Property Name	Value
Description:	A flag indicating whether the phone number can be used for automatically logging on the caller.
Notes:	Values: 0: Autologon disabled. 1: Autologon enabled.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_PhoneNumber.AutoLogon
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool

5.149. vw_Policy

A simple view for tbl_Policy.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DateCreated	datetime (8 bytes)	The date and time the policy was created.	
	DateExpires	datetime (8 bytes)	The date and time the policy automatically expires. Used to limit the period of time that a policy is active.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Policy object.	ObjectID
	RoleObjectId	char (36 characters)	The unique identifier of the Role object that specifies the privileges to be granted to the subject, for the target. For example, the role could be a "Technician."	ObjectID
	TargetAgencyObjectId	char (36 characters)	The unique identifier of the Agency object to which this policy applies.	ObjectID
	TargetDistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object to which this policy applies.	ObjectID
	TargetHandlerObjectId	char (36 characters)	The unique identifier of the Handler object to which this policy applies.	ObjectID
	TargetUserObjectId	char (36 characters)	The unique identifier of the user object to which this policy applies.	ObjectID
	TargetVmsObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this policy applies.	ObjectID
	UserObjectId	char (36 characters)	The unique identifier of the User object (subject) to which this policy is assigned.	ObjectID
	VmsObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this policy applies.	ObjectID

Stored Procedures

Name	Description
csp_PolicyCreate	Creates a new policy to give a user authorization to access a resource on a target by inserting a new row into tbl_Policy. This procedure assigns a role to a user, and then associates the policy to a target (distribution list, handler, user or VMS).

Name	Description
csp_PolicyDelete	Deletes a Policy object from tbl_Policy as specified by the @ObjectId parameter.
csp_PolicyModify	Updates the attributes of a Policy object based on the values passed in via the parameters. The @ObjectId parameter identifies the Policy object that is updated.

Column Properties

DateCreated

Property Name	Value
Description:	The date and time the policy was created.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Policy.DateCreated
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DateExpires

Property Name	Value
Description:	The date and time the policy automatically expires. Used to limit the period of time that a policy is active.
Notes:	One use of this column is for granting a user a particular policy temporarily. For example, the person who is assigned the role of a "User Administrator" is going on vacation. Create a policy with the role of a "User Administrator" and assign it to another user who is covering the duties of the vacationing administrator. Set the DateExpires column so that the policy expires automatically on the date when the primary "User Administrator" is scheduled to return from vacation.
Business Rules:	A value of NULL means the policy never expires.

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_Policy.DateExpires
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Policy object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Policy.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

RoleObjectId

Property Name	Value
Description:	The unique identifier of the Role object that specifies the privileges to be granted to the subject, for the target. For example, the role could be a "Technician."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Policy.RoleObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetAgencyObjectId

Property Name	Value
Description:	The unique identifier of the Agency object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetAgencyObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetDistributionListObjectId

Property Name	Value
Description:	The unique identifier of the DistributionList object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetDistributionListObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the Handler object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetUserObjectId

Property Name	Value
Description:	The unique identifier of the user object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetUserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TargetVmsObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this policy applies.
Notes:	This identifies the particular area (i.e., a node in the organizational hierarchy) of a Unity Organization that this policy applies to. For now, this can only be a LocationVMS, although in the future we do support multiple primary VMS as a method of partitioning.
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetVmsObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

UserObjectId

Property Name	Value
Description:	The unique identifier of the User object (subject) to which this policy is assigned.
Notes:	
Business Rules:	
Developer Notes:	May want to add DL or UserGroup as subject later, but for now it is just a User.
Table/Column Mapping:	tbl_Policy.UserId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VmsObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this policy applies.
Notes:	This identifies the particular area (i.e., a node in the organizational hierarchy) of a Unity Organization that this policy applies to. For now, this can only be a LocationVMS, although in the future we do support multiple primary VMS as a method of partitioning.
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetVmsObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.150. vw_Privilege

A view for tbl_Privilege, including the LocalizedName and LanguageCode for the privilege from tbl_LocalizedText.

Additional Information

This view is comprised of all the columns in the tbl_Privilege, plus the LocalizedName and LanguageCode columns from tbl_LocalizedText.

You need to include "WHERE LanguageCode=1033" or such to get the LocalizedName for the desired language from tbl_LocalizedText.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CreateAccess	smallint (2 bytes)	A flag indicating authorization to create a new instance of a particular object. For example, the ability to create distribution lists on the system and assign members.	Bool
	DeleteAccess	smallint (2 bytes)	A flag indicating authorization to delete an instance of an object. For example, the ability to delete a Class of Service (COS) from the system.	Bool
	DisplayName	lvarchar (1024 characters)	The localized name of the privilege, which is displayed in the SA.	
	ExecuteAccess	smallint (2 bytes)	A flag indicating authorization to execute (i.e. run) an application such as the ability to run Reports or to execute a tool or utility program.	Bool
PK	LanguageCode	int (4 bytes)	The language code (LCID) indicating the language of the text in the LocalizedName column.	Language-Code
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Privilege object.	ObjectID
	PrivilegeName	nvarchar (64 characters)	The unique text name of the privilege.	
	ReadAccess	smallint (2 bytes)	A flag indicating authorization to read (i.e., view) an object and its attributes. For example, the ability to read all the distribution lists on the system and their associated attributes such as members.	Bool
	ResourceType	int (4 bytes)	The type of resource (object) associated with this privilege. For example, Distribution Lists, Users, Classes of Service, Mailbox Databases, etc.	ResourceType

Key	Name	SQL Data Type/Length	Description	Custom Type
	UpdateAccess	smallint (2 bytes)	A flag indicating authorization to change the attribute(s) of an object. For example, the ability to change Class of Service (COS) settings.	Bool

Stored Procedures

vw_Privilege has no stored procedures.

Column Properties

CreateAccess

Property Name	Value
Description:	A flag indicating authorization to create a new instance of a particular object. For example, the ability to create distribution lists on the system and assign members.
Notes:	Values: 0: Not authorized to create a new instance of a particular object 1: Authorized to create a new instance of a particular object
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.CreateAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DeleteAccess

Property Name	Value
Description:	A flag indicating authorization to delete an instance of an object. For example, the ability to delete a Class of Service (COS) from the system.

Property Name	Value
Notes:	Values: 0: Not authorized to delete an instance of a particular object 1: Authorized to delete an instance of a particular object
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.DeleteAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The localized name of the privilege, which is displayed in the SA.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_LocalizedText.LocalizedName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (1024 characters)
Validation - Expression:	^[^\x00-\x1F\x7F\x0A\x0D]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	1024 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ExecuteAccess

Property Name	Value
Description:	A flag indicating authorization to execute (i.e. run) an application such as the ability to run Reports or to execute a tool or utility program.
Notes:	Values: 0: Not authorized to run a particular application 1: Authorized to run a particular application
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Privilege.ExecuteAccess
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LanguageCode

Property Name	Value
Description:	The language code (LCID) indicating the language of the text in the LocalizedName column.

Property Name	Value
Notes:	<p>You need to include "WHERE LanguageCode=1033" or such to get the LocalizedName for the desired language from tbl_LocalizedText.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241</p> <p>10249: English_Belize 10249</p> <p>1025: Arabic_Saudi_Arabia 1025</p> <p>10250: Spanish_Peru 10250</p> <p>1026: Bulgarian 1026</p> <p>1027: Catalan 1027</p> <p>1028: Chinese_Taiwan 1028</p> <p>1029: Czech 1029</p> <p>1030: Danish 1030</p> <p>1031: German_Standard 1031</p> <p>1032: Greek 1032</p> <p>1033: English_United_States 1033</p> <p>1034: Spanish_Traditional_Sort 1034</p> <p>1035: Finnish 1035</p> <p>1036: French_Standard 1036</p> <p>1037: Hebrew 1037</p> <p>1038: Hungarian 1038</p> <p>1039: Icelandic 1039</p> <p>1040: Italian_Standard 1040</p> <p>1041: Japanese 1041</p> <p>1042: Korean 1042</p> <p>1043: Dutch_Standard 1043</p> <p>1044: Norwegian_Bokmal 1044</p> <p>1045: Polish 1045</p> <p>1046: Portuguese_Brazilian 1046</p> <p>1047: Rhaeto-Romanic 1047</p> <p>1048: Romanian 1048</p> <p>1049: Russian 1049</p> <p>1050: Croatian 1050</p> <p>1051: Slovak 1051</p> <p>1052: Albanian 1052</p> <p>1053: Swedish 1053</p> <p>1054: Thai 1054</p> <p>1055: Turkish 1055</p> <p>1056: Urdu 1056</p> <p>1057: Indonesian 1057</p> <p>1058: Ukrainian 1058</p> <p>1059: Belarusian 1059</p> <p>1060: Slovenian 1060</p> <p>1061: Estonian 1061</p> <p>1062: Latvian 1062</p> <p>1063: Lithuanian 1063</p> <p>1065: Farsi 1065</p> <p>1066: Vietnamese 1066</p> <p>1067: Armenian 1067</p> <p>1068: Azeri_Latin 1068</p> <p>1069: Basque 1069</p> <p>1070: Sorbian 1070</p> <p>1071: Macedonian 1071</p> <p>1072: Sutu 1072</p> <p>1073: Tsonga 1073</p>

ResourceType

Property Name	Value
Description:	The type of resource (object) associated with this privilege. For example, Distribution Lists, Users, Classes of Service, Mailbox Databases, etc.

Property Name	Value
Notes:	<p>Values:</p> <p>1: Managing networking (Unity networking, dialing domains, delivery locations for foreign voice messaging systems)</p> <p>10: Managing Shared Distribution Lists.</p> <p>11: Managing restriction tables and restriction patterns.</p> <p>12: Managing call routing rules.</p> <p>13: Managing system schedules and holidays.</p> <p>14: Managing Administrative Regions. For example, the privilege to add/remove VMS configurations to/from an administrative region, or view a list of VMS configurations that compose an administrative region.</p> <p>15: Managing Unity organization. For example, the privileges to change the name of the organization, add/remove administrative regions to/from an organization, or view a list of administrative regions and VMS configurations that compose the Unity organization.</p> <p>16: Managing server(s) in a VMS configuration. For example, the privileges to add/delete a front-end or back-end server to/from the VMS configuration, activate/deactivate a server role on a VMS configuration.</p> <p>17: Managing server role templates. For example, the privileges to read/update VMS server role templates.</p> <p>18: Managing user groups. For example, the privileges to add/delete users to/from a user group, or create/delete a user group.</p> <p>19: Managing call handlers, call handler templates, and interview handlers. For example, the privileges to create/delete call and interview handlers, or to read/update call and interview handlers and call handler templates.</p> <p>2: Managing administrative roles (includes managing user to role relationships)</p> <p>20: Managing VMS server configuration settings, Report system settings and licensing settings. For example, the privileges to read/update the system's recording settings, phone and GUI language settings, voice messaging port settings, enable/disable a VMS configuration's participation in the Unity Organization license pool, etc.</p> <p>21: Run system reports and execute system reporting tools. For example, the privileges to run any of the System Reports such as the Administrative Access Report and any of the system reporting tools such as the Port Usage Analyzer tool.</p> <p>22: Run subscriber and mailbox reports. For example, the privileges to run any of the subscriber reports such as the Subscriber Message Activity Report or any of the Mailbox reports such as the Mailbox Database Information Report.</p> <p>23: View all reports. The privileges to view all system, subscriber and mailbox reports.</p> <p>24: Reset user passwords or PINs, and unlock user accounts.</p> <p>25: Reset administrative user account passwords and unlock administrative user accounts. For example, the privileges to reset the password for a user assigned the role of a 'Technician.'</p> <p>26: Managing Cisco Unity Connection security and user account lockout policies. For example, the privileges to read/update GUI/phone password restrictions and account lockout policies.</p> <p>27: Run all administration tools. For example, the privileges to run Disaster Recovery Backup/Restore tool, Subscriber Information Dump, TTY Angel, etc.</p> <p>28: Run ALL diagnostic, audio management and phone system integration tools. For example, the privileges to run the Set Record Format tool, CodecChecker tool, Cisco Unity Connection Performance Information and Diagnostics tool, Integration Monitor, Call Viewer, etc.</p> <p>29: Run status monitor application for monitoring system activity.</p> <p>3: Managing users</p> <p>30: Phone system.</p> <p>31: View and retrieve Configuration objects, localized text, and TreeControlNodes.</p> <p>32: IF (@NumericId IS NOT NULL) RAISERROR({GetExceptionCode("EXCEPTION_PERSONALGROUP_NUMERICID_INVALID") <@SEVERITY_INVALID_PARAMETER/>, 1, 'NULL', '0') <@StoredProcReturn GetExceptionCode("EXCEPTION_PARAMETER_INVALID")/></p>

Property Name	Value
	33: Managing Greetings. For example, the privilege to change the greeting for a call handler via the TUI. 34: Agency. Used by Community Voice Mail feature. 35: Web service access. 36: Managing interview handlers 37: Access serviceability page 38: VPIM controls 4: Changing User Name Attributes. 5: Managing users in bulk. 6: Managing user templates. 7: Managing mailbox databases. 8: Managing COS. 9: Managing directory handlers.

5.151. vw_RestrictionPattern

A simple view for tbl_RestrictionPattern.

A dial string that consists of a call pattern and a setting that specifies whether numbers matching the call pattern are permitted for use.

Additional Information

A restriction table can have any number of string patterns (i.e. "91?????????" or "011*") which can be marked for allow or disallow. A restriction table must have a least one dial string with a call pattern of "*" to ensure that Cisco Unity Connection is able to match a call pattern.

New dial strings are inserted into the restriction table as "Dial String n", n being the value of the Index column. Note that the order of the dial strings is very important because Cisco Unity Connection sequentially compares a phone number to the call patterns in the restriction table, starting with Dial String 0. If a number matches more than one call pattern, the number is handled according to the first call pattern it matches. See also tbl_RestrictionTable.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Blocked	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection permits the use of dial strings matching the pattern.	Bool
	NumberPattern	nvarchar (40 characters)	The specific numbers or patterns of numbers (including external and long-distance access codes) that can be permitted or restricted.	
PK	ObjectId	char (36 characters)	Surrogate key for the table.	ObjectID
	RestrictionTableObjectId	char (36 characters)	The unique identifier of the RestrictionTable object to which this restriction pattern belongs.	ObjectID
	SequenceNumber	smallint (2 bytes)	A sequential index for this RestrictionPattern within the parent RestrictionTable, which specifies the order in which Cisco Unity Connection will apply each call pattern.	

Stored Procedures

Name	Description
csp_RestrictionPatternCreate	Creates a new RestrictionPattern object by inserting a new row into tbl_RestrictionPattern. A RestrictionPattern contains dial strings consisting of a call pattern and a setting that specifies whether numbers matching the call pattern are permitted for use.
csp_RestrictionPatternDelete	Deletes a RestrictionPattern object from tbl_RestrictionPattern as specified by the @ObjectId parameter.

Name	Description
csp_RestrictionPatternModify	Updates the attributes of a RestrictionPattern object based on the values passed in via the parameters. The @ObjectId parameter identifies the RestrictionPattern object that is updated.

Column Properties

Blocked

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection permits the use of dial strings matching the pattern.
Notes:	Values: 0: Permit use of dial strings matching the pattern 1: Do not permit use of dial strings matching the pattern
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionPattern.Blocked
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NumberPattern

Property Name	Value
Description:	The specific numbers or patterns of numbers (including external and long-distance access codes) that can be permitted or restricted.

Property Name	Value
Notes:	<p>Uses digits 0 through 9 plus the following special characters:</p> <ul style="list-style-type: none"> * Match zero or more digits ? Match exactly one digit. Each ? serves as a placeholder for one digit. # Corresponds to the # key on the phone <p>For example, to screen out all phone numbers that start with 206 but are longer than 7 digits, enter 9206?????* for the pattern (and set "Blocked" == true).</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionPattern.NumberPattern
Primary Key:	False
Allow Null:	False
Default Value:	'*'
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9#?]*\$
Validation - Description:	Digits 0-9, special characters question mark, asterisk, and hash ("#") are also allowed.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	Surrogate key for the table.
Notes:	The "real" PK is (RestrictionTableObjectId,SequenceNumber), but since we automatically change SequenceNumber on deletion to close gaps there needs to be a more permanent identifier to use.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionPattern.ObjectId

SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	999

5.152. vw_RestrictionTable

A simple view for tbl_RestrictionTable.

A list of dial strings, each consisting of a call pattern and a setting that specifies whether numbers matching the call pattern are permitted for use. Restriction tables control which phone numbers subscribers can use for transferring calls, recording and playback by phone from Cisco Unity Connection applications, delivering faxes to a fax machine, and sending message notifications.

Additional Information

Each restriction table has a maximum number of digits allowed and a list of number patterns which are to be blocked or allowed. Each restriction table must have a least one dial string containing a call pattern. When a restriction table is applied to a number (such as a pager number for a message notification), Cisco Unity Connection compares the number with the call pattern of the first dial string in the restriction table. If the number does not match the call pattern, Cisco Unity Connection then compares the number with the call pattern in the second dial string, and so on, until it finds a match and the number does not exceed the maximum number of digits allowed. When Cisco Unity Connection finds a match, it either permits or restricts the use of this number as specified in the dial string.

Restriction tables are assigned to subscribers via COS. Each COS specifies for its members three restriction table entries: one for call transfer phone numbers, one for outcalling (message delivery) phone numbers, and one for fax delivery phone numbers.

When a subscriber uses the Cisco Unity Assistant or the Cisco Unity Connection conversation to attempt to change a phone number that is used for message notification, fax delivery, or call transfer, or when subscribers use Caller system transfers to transfer to a number that they specify, Cisco Unity Connection applies the applicable restriction table to verify that the phone number entered is allowed. The same thing happens when an administrator uses Cisco Unity Connection Administration to attempt to change a phone number that is used for message notification, fax delivery, or call transfer. In each case, the restriction table used is the one associated with the subscriber or administrator who is changing the number.

Note that the restriction table applies at the time of the entry of the number, not at the time of the use of the number. The restriction table in the COS of the person making the change is the one checked. For example, a given subscriber may be restricted from entering a long-distance message delivery or call transfer number, but an administrator can enter a long-distance number into the subscriber record for them if desired.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CreationTime	datetime (8 bytes)	The date and time this restriction table was created.	
	DefaultBlocked	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection permits the phone number in the case where a phone number does not match any call patterns in this restriction table.	Bool
	DisplayName	nvarchar (64 characters)	The unique text name of this restriction table to be used when displaying entries in the administrative console. For example, "{Default Transfer}."	DisplayName
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this restriction table belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	MaxDigits	smallint (2 bytes)	The maximum number of digits in a dial string (including access codes) allowed by Cisco Unity Connection.	
	MinDigits	smallint (2 bytes)	The minimum number of digits in a dial string (including access codes) allowed by Cisco Unity Connection.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a RestrictionTable object.	ObjectID
	Undeetable	smallint (2 bytes)	A flag indicating whether this restriction table can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool

Stored Procedures

Name	Description
csp_RestrictionTableCreate	Creates a new RestrictionTable object by inserting a new row into tbl_RestrictionTable. A RestrictionTable object is used to control which phone numbers subscribers can use for transferring calls, recording and playback by phone from Cisco Unity Connection applications, delivering faxes to a fax machine, and sending message notifications.
csp_RestrictionTableDelete	Deletes a RestrictionTable object from tbl_RestrictionTable as specified by the @ObjectId parameter.
csp_RestrictionTableEvaluate	Evaluates a phone number against a specified restriction table (and restriction patterns) to determine if it should be blocked (restricted) or not.
csp_RestrictionTableModify	Updates the attributes of a RestrictionTable object based on the values passed in via the parameters. The @ObjectId parameter identifies the RestrictionTable object that is updated.

Column Properties

CreationTime

Property Name	Value
Description:	The date and time this restriction table was created.
Notes:	
Business Rules:	The default value is the current system date and time.
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionTable.CreationTime

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultBlocked

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection permits the phone number in the case where a phone number does not match any call patterns in this restriction table.
Notes:	This condition should never occur. By default, all restriction tables should have * as the call pattern in the last dial string of the table and an administrator should not be allowed to modify this call pattern setting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionTable.DefaultBlocked
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The unique text name of this restriction table to be used when displaying entries in the administrative console. For example, "{Default Transfer}."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionTable.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName

Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this restriction table belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionTable.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxDigits

Property Name	Value
Description:	The maximum number of digits in a dial string (including access codes) allowed by Cisco Unity Connection.
Notes:	Only dial strings that contain a number of digits fewer than or equal to the number of digits specified in this column are checked against the restriction table. Dial strings that contain more than the number of digits specified in this column are not permitted. For example, if local calls in your area are seven digits long, and you want to prevent subscribers from using long distance phone numbers, enter 8 in this column. (A local number plus the access code for the phone system equals 8 digits.)
Business Rules:	
Developer Notes:	2007-01-10 ekostenb - Increased default value from 30 to 40 to be consistent with max length of DtmfAccessId. (See CSCse35826).
Table/Column Mapping:	tbl_RestrictionTable.MaxDigits
Primary Key:	False
Allow Null:	False
Default Value:	40
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	300

MinDigits

Property Name	Value
Description:	The minimum number of digits in a dial string (including access codes) allowed by Cisco Unity Connection.
Notes:	Only dial strings that contain a number of digits greater than or equal to the number of digits specified in this column are checked against the restriction table. Dial strings that contain fewer than the number of digits specified in this column are not permitted. For example, to prohibit subscribers from using four-digit numbers, enter a value of 5 in this column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RestrictionTable.MinDigits
Primary Key:	False
Allow Null:	False
Default Value:	1

Property Name	Value

5.153. vw_Role

A simple view for tbl_Role containing all Roles that are enabled (IsEnabled=1).

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	IsEnabled	smallint (2 bytes)	A flag indicating whether the role is enabled and is available in the SA.	Bool
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Role object.	ObjectID
	ReadOnly	smallint (2 bytes)	Is role read-only?	Bool
	RoleDescription	lvarchar (256 characters)	A description of the purpose of this role and its assigned capabilities.	
	RoleName	nvarchar (64 characters)	The given, unique text name of the user role. For example, "User Administrator," "Help Desk Administrator," "Technician," etc.	

Stored Procedures

Name	Description
csp_RoleCreate	Creates a new Role object by inserting a new row into tbl_Role. A Role consists of a range of authorized operations for users that control access to the system.
csp_RoleDelete	Deletes a Role object from tbl_Role as specified by the @ObjectId parameter.
csp_RoleModify	Updates the attributes of a Role object based on the values passed in via the parameters. The @ObjectId parameter identifies the Role object that is updated.

Column Properties

IsEnabled

Property Name	Value
Description:	A flag indicating whether the role is enabled and is available in the SA.

Property Name	Value
Notes:	This flag is used primarily to hide roles associated with the Community Voice Mail application from the standard product. Values: 0: Role disabled, do not display in the SA 1: Role is enabled, display in the SA
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Role.IsEnabled
Primary Key:	False
Allow Null:	False

5.154. vw_RolePrivilegeMap

A simple view for tbl_RolePrivilegeMap.
A mapping of a privilege to a role.

Additional Information

A role can be associated with one or more privileges.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	PrivilegeObjectId	char (36 characters)	The unique identifier of the Privilege object that is mapped to the specified role.	ObjectID
PK	RoleObjectId	char (36 characters)	The unique identifier of the Role object that is mapped to the specified privilege.	ObjectID

Stored Procedures

vw_RolePrivilegeMap has no stored procedures.

Column Properties

PrivilegeObjectId

Property Name	Value
Description:	The unique identifier of the Privilege object that is mapped to the specified role.

5.155. vw_RoutingRule

Contains a series of rules that let Cisco Unity Connection determine how to route incoming calls (e.g., to the operator, a specific subscriber, call handler, directory handler, or interview handler) based on the information that Cisco Unity Connection may have about a call, such as the calling phone number (ANI or caller ID), the trunk or port on which the call comes in, the dialed phone number (DNIS), the forwarding station, and the schedule.

Additional Information

This view is comprised of all the columns in the tbl_RoutingRule table, plus columns from the call action object it references.

When Cisco Unity Connection receives a call, it first determines if it is a direct or forwarded call based on the information contained in the serial or DTMF packet sent by the phone system, and then applies the applicable call routing table. If the call information matches all of the settings for the first rule, the call is routed as specified in the rule. If any call information does not match the settings specified in the first rule, the call information is then compared to the settings of the second rule, and so on, until a rule is found that matches all the characteristics of the call.

The integration between the phone system and Cisco Unity Connection determines the information that is provided about a call (for example, call type, port, trunk, calling number, and dialed number). The schedule is determined by the date and time the call is received.

Cisco Unity Connection has four predefined routing rules. The predefined routing rules for Direct Calls are:

- * Attempt Sign-In - Sends calls from subscribers to the subscriber logon conversation.
- * Default Call Handler - Sends calls from unidentified callers to the opening greeting.

The predefined rules for Forwarded Calls are:

- * Attempt Forward to Greeting - Sends all calls from a subscriber extension to the subscriber greeting.
- * Default Call Handler - Sends calls forwarded from an extension that is not associated with a subscriber to the opening greeting.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that Cisco Unity Connection will take (as specified by the CallAction object) if this rule evaluates to true.	ObjectID
	CallType	smallint (2 bytes)	The type of call.	RoutingRule-CallType
	DisplayName	nvarchar (64 characters)	The unique text name of the routing rule to be used when displaying entries in the administrative console. For example, the display name for the default routing rule for attempting subscriber sign-in is "Attempt Sign-In."	DisplayName
	Flags	smallint (2 bytes)	A flag indicating whether the rule can be edited or deleted.	RoutingRule-Flags

Key	Name	SQL Data Type/Length	Description	Custom Type
	LanguageCode	int (4 bytes)	The Windows Locale ID (LCID) identifying the language Cisco Unity Connection will associate with the call.	Language-Code
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a RoutingRule object.	ObjectID
	Route_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	Route_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	Route_TargetHandlerDisplayName	nvarchar (64 characters)	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."	DisplayName
	Route_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	Route_TargetHandlerObjectType	smallint (2 bytes)	The type of handler (CallHandler, InterviewHandler, or DirectoryHandler) for this object.	ObjectType
	RuleIndex	smallint (2 bytes)	The order in which Cisco Unity Connection executes the rules. A zero-based index is used to determine the order.	
	State	smallint (2 bytes)	The state of the rule (active, inactive, or invalid).	RuleState
	Type	smallint (2 bytes)	The type of rule based on call type (direct, forwarded, or system).	RoutingRule-Type
	UseCallLanguage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.	Bool
	UseDefaultLanguage	smallint (2 bytes)	A flag indicating whether the language for this routing rule is derived from the routing rule object attribute or the default language from the location to which the routing rule belongs. Always use the LanguageCode column - if this is set, then the column LanguageCode is being derived directly from the location.	Bool

Stored Procedures

Name	Description
csp_RoutingRuleCreate	Creates a new RoutingRule by inserting a row into tbl_RoutingRule. The new rule is added to the top of the list.
csp_RoutingRuleDelete	Deletes a RoutingRule object from tbl_RoutingRule as specified by the @ObjectId parameter. All rules below the one deleted are moved up in the list by one.

Name	Description
csp_RoutingRuleModify	Updates the attributes of a RoutingRule object based on the values passed in via the parameters. The @ObjectId parameter identifies the RoutingRule object that is updated.

Column Properties

CallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that Cisco Unity Connection will take (as specified by the CallAction object) if this rule evaluates to true.

Property Name	Value
Notes:	<p>Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible actions that Cisco Unity Connection can take depending on a routing rule evaluating to true. In Unity 4.0(4), the possible conversations to route to are as follows:</p> <ul style="list-style-type: none"> * AD - Sends the call to the specified directory handler. * AttemptForward - Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * AvConvEasySignIn. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * AvConvSubSystemTransfer - Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * AvConvSystemTransfer - Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * CHInterview - Sends the call to the specified interview handler. * ConvCVMBoxReset - This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotelCheckedOut - When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - This is a special conversation for "Live Record." * GreetingsAdministrator - Sends the call to a conversation for changing call handler greetings over the phone. For example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed. * PHGreeting - Sends the call to the greeting of the specified subscriber. * PHTransfer - Sends the call to the specified call handler. * SubSignIn - Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. <p>Please refer to tbl_Conversation for more information.</p>
Business Rules:

Route_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName

Validation - Maximum Value:	

Route_TargetHandlerDisplayName

Property Name	Value
Description:	The text name of the handler to be used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration. For example, the display name for the default opening greeting call handler is "Opening Greeting."
Notes:	The display name for a primary call handler is not shown anywhere on the administrative console since it's associated with a subscriber that has their own display name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Route_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Route_TargetHandlerObjectType

Property Name	Value
Description:	The type of handler (CallHandler, InterviewHandler, or DirectoryHandler) for this object.

Property Name	Value
Notes:	<p>Having the type here is mainly for efficiency - it would be possible to query the other tables to find which had this same object id, but that is more expensive.</p> <p>Values:</p> <p>0: Reserved - not assigned to an object.</p> <p>1: User account type.</p> <p>10: Template for creating a new user.</p> <p>100: Group owned by a Unity user.</p> <p>102: Personal address book type information for persons who are not Unity voice mail users.</p> <p>103: System call routing rule.</p> <p>11: Credential (i.e., password) policy for user accounts.</p> <p>12: A table containing a list of phone numbers subscribers can use for transferring calls, recording and playback by phone from Cisco Unity Connection applications, delivering faxes to a fax machine, and sending message notifications.</p> <p>13: A collection of privileges that control administrative access to the system.</p> <p>14: Discrete rights granted to perform an operation on a type of resource.</p> <p>15: Grants a user a Role in a particular area.</p> <p>16:</p> <p>17: Associates a user as a member of a system PDL.</p> <p>18:</p> <p>19:</p> <p>2: System distribution list.</p> <p>20: Unknown object type.</p> <p>21: User that has a subscription to a voice mail service and as such also is assigned at least one mailbox.</p> <p>22: A user in a remote mail system.</p> <p>3: CallHandler</p> <p>5: Special case call handler that asks the caller up to 20 questions.</p> <p>6: Directory Handler used to search a subset of the directory. Formerly referred to as "NameLookupHandler."</p> <p>64: Holds members of a voice mail user's private distribution list.</p> <p>65: Transfer rule for contacting a voice mail user. Formerly referred to as "Contact Rule."</p> <p>66: Defines the greeting to play and the action to take for a call handler. Formerly referred to as "Messaging Rule."</p> <p>67: Touch-tone menu entry for a call handler.</p> <p>68: The number or number pattern to be locked or allowed in Restriction table.</p> <p>69: A question associated with an interview handler.</p> <p>7: A schedule.</p> <p>70: Special type of notification device used to set/clear message waiting indication on phone.</p> <p>71: Set of parameters for phone, fax or pager for notification of new messages.</p> <p>72: Specifies when and which notification device is used for notification of a new message.</p> <p>8: Class of service.</p> <p>9:</p> <p>95: VPIM location.</p> <p>97: Bridge location.</p> <p>98: AMIS location.</p> <p>99: A Virtual Messaging System (VMS) location.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Handler.ObjectType
Primary Key:	False

Allow Null:	False
Default Value:	3
Custom Type:	ObjectType
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RuleIndex

Property Name	Value
Description:	The order in which Cisco Unity Connection executes the rules. A zero-based index is used to determine the order.
Notes:	Rules are ordered from 0 to N, and are executed in order.
Business Rules:	
Developer Notes:	There is no maximum value constraint.
Table/Column Mapping:	tbl_RoutingRule.RuleIndex
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

State

Property Name	Value
Description:	The state of the rule (active, inactive, or invalid).

Property Name	Value
Notes:	Values: 0: Active - rule is active. 1: Inactive - rule is inactive. 2: Invalid - the rule is invalid.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RoutingRule.State
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	RuleState
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Type

Property Name	Value
Description:	The type of rule based on call type (direct, forwarded, or system).
Notes:	Values: 1: Direct - calls from subscribers and unidentified callers that are dialed directly to Cisco Unity Connection. 2: Forwarded - calls forwarded from specific extensions are routed according to the defined rules. 3: System - both calls from unidentified callers or calls forwarded from an extension that is not associated with a subscriber account are routed to the Opening Greeting via the "Default Call Handler" rule. This is the last rule in the routing rule table
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RoutingRule.Type

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseCallLanguage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will use the language assigned to the call.
Notes:	System call routing rules specify a language for the call. This flag would be used only in those extremely rare situations where a call goes from a routing rule to a call handler, and then back to another routing rule.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RoutingRule.UseCallLanguage
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	A flag indicating whether the language for this routing rule is derived from the routing rule object attribute or the default language from the location to which the routing rule belongs. Always use the LanguageCode column - if this is set, then the column LanguageCode is being derived directly from the location.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False

Property Name	Value
Allow Null:	False

5.156. vw_RoutingRuleCondition

Condition of a routing rule (system call routing rule)
The condition elements of a routing rule

Additional Information

Each routing rule comprised of zero or more conditions. There is an implicit "and" between all of the conditions ("or" is not supported).

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	CallType	smallint (2 bytes)	The type of call.	RoutingRule-CallType
PK	ObjectId	char (36 characters)	Unique identifier for this condition	ObjectID
	OperandValue	varchar (64 characters)	Value of operand in condition	
	Operator	int (4 bytes)	Type of operator in this condition - equals, greater than, etc.	RoutingRule-Operator
	Parameter	int (4 bytes)	Type of parameter in this condition - port, calling number, etc.	RoutingRule-Parameter
	RoutingRuleObjectId	char (36 characters)	Object Id of the routing rule this condition belongs to	ObjectID

Stored Procedures

Name	Description
csp_RoutingRuleConditionCreate	Create a row in tbl_RoutingRuleCondition
csp_RoutingRuleConditionDelete	Delete a row in tbl_RoutingRuleCondition
csp_RoutingRuleConditionModify	Modify a row in tbl_RoutingRuleCondition

Column Properties

CallType

Property Name	Value
Description:	The type of call.

Property Name	Value
Notes:	Values: 0: 1: 2:
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_RoutingRule.CallType
Primary Key:	False

5.159. vw_Schedule

A simple view for tbl_Schedule.

An ordered list of dates and times that Cisco Unity Connection uses to manage calls. A schedule is used to establish standard hours versus closed hours for a system or subscriber (what greeting to play when and the action to take after the greeting). A schedule is also used for personal routing rules (when/where to transfer incoming calls), and notification rules (when/where to notify a Subscriber of messages).

See ScheduleSet for more information on how Schedules are used.

Additional Information

Holidays are defined using a schedule now, and instead of a "exclude holiday" check box they can be added to schedule sets with "exclude".

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The preferred text name of this schedule to be used when displaying entries in the administrative console and Cisco Personal Assistant.	DisplayName
	EndDate	datetime (8 bytes)	The date and time when schedule ends, or NULL if effective indefinitely.	
	IsHoliday	smallint (2 bytes)	A flag indicating whether this schedule represents a holiday.	Bool
	LastModified	datetime (8 bytes)	The date and time this schedule was last modified in Exchange - for synchronization.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Schedule object.	ObjectID
	Owner_LocationObjectId	char (36 characters)	The owner of this schedule. If the owner is a LocationVMS, the unique identifier of the LocationVMS object to which this schedule belongs. Commonly referred to as a "system" schedule. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_PersonalRuleSetObjectId	char (36 characters)	The owner of this schedule. If the owner is a personal rule set, the unique identifier of the PersonalRuleSet to which this schedule belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_SubscriberObjectId	char (36 characters)	The owner of this schedule. If the owner is a subscriber, the unique identifier of the Subscriber object to which this schedule belongs. Otherwise, this attribute is set to NULL.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	StartDate	datetime (8 bytes)	The date and time when schedule becomes active, or NULL if active immediately.	
	Undeetable	smallint (2 bytes)	A flag indicating whether this schedule can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool

Stored Procedures

Name	Description
csp_ScheduleCreate	Creates a new Schedule object by inserting a new row into tbl_Schedule.
csp_ScheduleDelete	Deletes a Schedule object from tbl_Schedule as specified by the @ObjectId parameter.
csp_ScheduleIsActive	Determines if a Schedule is currently active. Returns a value of 1 in @IsActive if the Schedule object specified by @ScheduleObjectId is found to be active.
csp_ScheduleModify	Updates the attributes of a Schedule object based on the values passed in via the parameters. The @ObjectId parameter identifies the Schedule object that is updated.

Column Properties

Owner_LocationObjectid

Property Name	Value
Description:	The owner of this schedule. If the owner is a LocationVMS, the unique identifier of the LocationVMS object to which this schedule belongs. Commonly referred to as a "system" schedule. Otherwise, this attribute is set to NULL.
Notes:	Only one Owner_*Objectid column should contain a non-null value. All other Owner_*Objectid columns should contain NULL.
Business Rules:	A schedule must have a owner and can have only one owner.
Developer Notes:	
Table/Column Mapping:	tbl_Schedule.Owner_LocationObjectid
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_PersonalRuleSetObjectid

Property Name	Value
Description:	The owner of this schedule. If the owner is a personal rule set, the unique identifier of the PersonalRuleSet to which this schedule belongs. Otherwise, this attribute is set to NULL.
Notes:	Schedules for rules are created behind the scenes, and should not be visible to subscribers. Therefore they are owned by the RuleSet instead. They are also removed with the rule on delete that way. Only one Owner_*ObjectId column should contain a non-null value. All other Owner_*ObjectId columns should contain NULL.
Business Rules:	A schedule must have a owner and can have only one owner.
Developer Notes:	
Table/Column Mapping:	tbl_Schedule.Owner_PersonalRuleSetObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectId
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_SubscriberObjectId

Property Name	Value
Description:	The owner of this schedule. If the owner is a subscriber, the unique identifier of the Subscriber object to which this schedule belongs. Otherwise, this attribute is set to NULL.
Notes:	Only one Owner_*ObjectId column should contain a non-null value. All other Owner_*ObjectId columns should contain NULL.
Business Rules:	A schedule must have a owner and can have only one owner.
Developer Notes:	
Table/Column Mapping:	tbl_Schedule.Owner_SubscriberObjectId

5.160. vw_ScheduleDetail

A simple view for tbl_ScheduleDetail.

A single schedule event that specifies what day(s) of the week the event is active, and between what times. A schedule can have multiple schedule details.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DirectoryId	lvvarchar (2048 characters)	The ID of this object in the directory or message store if it represents an appointment in another groupware package.	DirectoryId
	EndDate	datetime (8 bytes)	The date when this schedule detail ends. A value of NULL indicates the scheule is active indefinitely.	
	EndTime	int (4 bytes)	The end time (in minutes) for the active day or days. The end time is stored as the number of minutes from midnight. So a value of 480 would mean 8:00 AM and 1020 would mean 5:00 PM. In addition, a value of NULL means "till the end of the day" (e.g. 11:59:59 PM in Linux land).	
	IsActiveFriday	smallint (2 bytes)	A flag indicating whether this schedule is active on Friday.	Bool
	IsActiveMonday	smallint (2 bytes)	A flag indicating whether this schedule is active on Monday.	Bool
	IsActiveSaturday	smallint (2 bytes)	A flag indicating whether this schedule is active on Saturday.	Bool
	IsActiveSunday	smallint (2 bytes)	A flag indicating whether this schedule is active on Sunday.	Bool
	IsActiveThursday	smallint (2 bytes)	A flag indicating whether this schedule is active on this Thursday.	Bool
	IsActiveTuesday	smallint (2 bytes)	A flag indicating whether this schedule is active on Tuesday.	Bool
	IsActiveWednesday	smallint (2 bytes)	A flag indicating whether this schedule is active on Wednesday.	Bool
	LastModified	datetime (8 bytes)	The time this appointment was last modified in Exchange - for synchronization.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a ScehduelDetail object.	ObjectID
	ScheduleObjectId	char (36 characters)	The unique identifier of the parent Schedule object to which this schedule detail row belongs.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	StartDate	datetime (8 bytes)	The date when this schedule detail becomes active. A value of NULL means the schedule is active immediately.	
	StartTime	int (4 bytes)	The start time (in minutes) for the active day or days. The start time is stored as the number of minutes from midnight. So a value of 480 would mean 8:00 AM and 1020 would mean 5:00 PM. In addition, a value of NULL for the start time indicates 12:00 AM.	
	Subject	nvarchar (2048 characters)	The subject matter or description for this schedule detail row.	

Stored Procedures

Name	Description
csp_ScheduleDetailCreate	Creates a new ScheduleDetail object by inserting a new row into tbl_ScheduleDetail.
csp_ScheduleDetailDelete	Deletes a ScheduleDetail object from tbl_ScheduleDetail as specified by the @ObjectId parameter.
csp_ScheduleDetailModify	Updates the attributes of a ScheduleDetail object based on the values passed in via the parameters. The @ObjectId parameter identifies the ScheduleDetail object that is updated.

Column Properties

DirectoryId

Property Name	Value
Description:	The ID of this object in the directory or message store if it represents an appointment in another groupware package.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.DirectoryId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId
SQL Data Type/Length:	nvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$

Property Name	Value
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EndDate

Property Name	Value
Description:	The date when this schedule detail ends. A value of NULL indicates the scheule is active indefinitely.
Notes:	Although the EndDate date is stored as calendar date and time, the time portion of the value is disregarded.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.EndDate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EndTime

Property Name	Value
Description:	The end time (in minutes) for the active day or days. The end time is stored as the number of minutes from midnight. So a value of 480 would mean 8:00 AM and 1020 would mean 5:00 PM. In addition, a value of NULL means "till the end of the day" (e.g. 11:59:59 PM in Linux land).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.EndTime

Property Name	Value
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	1440

IsActiveFriday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Friday.
Notes:	Values: 0: Not active on Friday 1: Active on Friday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveFriday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveMonday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Monday.

Property Name	Value
Notes:	Values: 0: Not active on Monday 1: Active on Monday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveMonday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveSaturday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Saturday.
Notes:	Values: 0: Not active on Saturday 1: Active on Saturday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveSaturday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveSunday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Sunday.
Notes:	Values: 0: Not active on Sunday 1: Active on Sunday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveSunday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveThursday

Property Name	Value
Description:	A flag indicating whether this schedule is active on this Thursday.
Notes:	Values: 0: Not active on Thursday 1: Active on Thursday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveThursday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveTuesday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Tuesday.
Notes:	Values: 0: Not active on Tuesday 1: Active on Tuesday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveTuesday
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsActiveWednesday

Property Name	Value
Description:	A flag indicating whether this schedule is active on Wednesday.
Notes:	Values: 0: Not active on Wednesday 1: Active on Wednesday
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.IsActiveWednesday
Primary Key:	False
Allow Null:	False
Default Value:	0

Property Name	Value
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastModified

Property Name	Value
Description:	The time this appointment was last modified in Exchange - for synchronization.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.LastModified
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a ScehduelDetail object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.ObjectId

Property Name	Value
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleObjectId

Property Name	Value
Description:	The unique identifier of the parent Schedule object to which this schedule detail row belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.ScheduleObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

StartDate

Property Name	Value
Description:	The date when this schedule detail becomes active. A value of NULL means the schedule is active immediately.

Property Name	Value
Notes:	Although the StartDate is stored as calendar date and time, the time portion of the value is disregarded.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.StartDate
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

StartTime

Property Name	Value
Description:	The start time (in minutes) for the active day or days. The start time is stored as the number of minutes from midnight. So a value of 480 would mean 8:00 AM and 1020 would mean 5:00 PM. In addition, a value of NULL for the start time indicates 12:00 AM.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.StartTime
Primary Key:	False
Allow Null:	True
Default Value:	NULL

SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	1440

Subject

Property Name	Value
Description:	The subject matter or description for this schedule detail row.
Notes:	Used primarily when synchronizing schedules with groupware systems such as Exchange.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleDetail.Subject
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.161. vw_ScheduleSet

A simple view for tbl_ScheduleSet.

A combination of one or more schedules. For example, there could be a system schedule set that contains working hours and holidays (using the exclude option).

Additional Information

To enable this type of schedule combining, notification rules and call handlers will refer to a ScheduleSet object and not a Schedule object directly.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The unique text name of this schedule set to be used when displaying entries in the administrative console and Cisco Personal Assistant.	DisplayName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a ScheduleSet object.	ObjectID
	Owner_LocationObjectId	char (36 characters)	The owner of this schedule set. If the owner is a LocationVMS, the unique identifier of the LocationVMS object to which this schedule set (i.e., "system" schedule) belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_PersonalRuleSetObjectId	char (36 characters)	The owner of this schedule set. If the owner is a personal rule set, the unique identifier of the PersonalRuleSet to which this schedule set belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_SubscriberObjectId	char (36 characters)	The owner of this schedule set. If the owner is a subscriber, the unique identifier of the Subscriber object to which this schedule set belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Undeleteable	smallint (2 bytes)	A flag indicating whether this schedule set can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool

Stored Procedures

Name	Description
csp_ScheduleSetCreate	Creates a new ScheduleSet object by inserting a new row into tbl_ScheduleSet. A ScheduleSet is a group of schedules.
csp_ScheduleSetDelete	Deletes a ScheduleSet object from tbl_ScheduleSet as specified by the @ObjectId parameter.
csp_ScheduleSetIsActive	Determines if a ScheduleSet is currently active. Returns a value of 1 in @IsActive if the ScheduleSet object specified by @ScheduleSetObjectId is found to be active.
csp_ScheduleSetModify	Updates the attributes of a ScheduleSet object based on the values passed in via the parameters. The @ObjectId parameter identifies the ScheduleSet object that is updated.

Column Properties

DisplayName

Property Name	Value
Description:	The unique text name of this schedule set to be used when displaying entries in the administrative console and Cisco Personal Assistant.
Notes:	
Business Rules:	The name of the schedule set must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSet.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a ScheduleSet object.

Property Name	Value
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSet.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_LocationObjectId

Property Name	Value
Description:	The owner of this schedule set. If the owner is a LocationVMS, the unique identifier of the LocationVMS object to which this schedule set (i.e., "system" schedule) belongs. Otherwise, this attribute is set to NULL.
Notes:	Only one Owner_*ObjectId column should contain a non-null value. All other Owner_*ObjectId columns should contain NU
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSet.Owner_LocationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_PersonalRuleSetObjectId

Property Name	Value
Description:	The owner of this schedule set. If the owner is a personal rule set, the unique identifier of the PersonalRuleSet to which this schedule set belongs. Otherwise, this attribute is set to NULL.
Notes:	Only one Owner_*ObjectId column should contain a non-null value. All other Owner_*ObjectId columns should contain NU
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSet.Owner_PersonalRuleSetObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_SubscriberObjectId

Property Name	Value
Description:	The owner of this schedule set. If the owner is a subscriber, the unique identifier of the Subscriber object to which this schedule set belongs. Otherwise, this attribute is set to NULL.
Notes:	Only one Owner_*ObjectId column should contain a non-null value. All other Owner_*ObjectId columns should contain NU
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSet.Owner_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)

Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.162. vw_ScheduleSetMemberMap

A simple view for tbl_ScheduleSetMemberMap.
A mapping of a schedule to a schedule set.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Exclude	smallint (2 bytes)	A flag indicating whether the schedule is to be included or excluded from the schedule set.	Bool
PK	ScheduleObjectId	char (36 characters)	The unique identifier of the Schedule object that is a member of the schedule set.	ObjectID
PK	ScheduleSetObjectId	char (36 characters)	The unique identifier of the ScheduleSet object to which the schedule belongs.	ObjectID

Stored Procedures

Name	Description
csp_ScheduleSetMemberMapCreate	Creates a new ScheduleSetMemberMap object by inserting a new row into tbl_ScheduleSetMemberMap thereby assigning a Schedule to a particular ScheduleSet.
csp_ScheduleSetMemberMapDelete	Deletes a ScheduleSetMemberMap object from tbl_ScheduleSetMemberMap as specified by the @ScheduleObjectId and @ScheduleSetObjectId parameters.

Column Properties

Exclude

Property Name	Value
Description:	A flag indicating whether the schedule is to be included or excluded from the schedule set.
Notes:	Values: 0: Include 1: Exclude
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_ScheduleSetMemberMap.Exclude
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleObjectId

Property Name	Value
Description:	The unique identifier of the Schedule object that is a member of the schedule set.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSetMemberMap.ScheduleObjectId
Primary Key:	True
Allow Null:	False
Default Value:

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ScheduleSetObjectId

Property Name	Value
Description:	The unique identifier of the ScheduleSet object to which the schedule belongs.

Property Name	Value
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_ScheduleSetMemberMap.ScheduleSetObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.163. vw_SchemaInformation

Simple view for tbl_SchemaInformation
The schema version for the database.

Additional Information

This table will contain a history of all upgrades.

This table does not have any constraints. Data will be inserted into the table before constraints become active.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	Build	int (4 bytes)	The schema build version.	
PK	CreationTime	datetime (8 bytes)	The date and time when the record was created.	
	IsCurrent	smallint (2 bytes)	The current product version.	
PK	Major	int (4 bytes)	The major version of the schema.	
PK	Minor	int (4 bytes)	The minor version of the schema.	
	Product	varchar (32 characters)	The product version.	

Stored Procedures

vw_SchemaInformation has no stored procedures.

Column Properties

Build

Property Name	Value
Description:	The schema build version.

5.164. vw_ScopeDistributionListMember

Internal use only.

Additional Information

Flattened out list of DL members for use by Directory Handlers with DList scope.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DistributionListObjectId	char (36 characters)	The unique identifier of the DistributionList object to which this distribution list member belongs.	ObjectID
	MemberContactObjectId	char (36 characters)	The member of this distribution list. If the member is a contact, the unique identifier of the Contact object that is a member of the distribution list. Otherwise this attribute is set to NULL.	ObjectID
	MemberUserObjectId	char (36 characters)	The member of this distribution list. If the member is a user, the unique identifier of the User object that is a member of the distribution list. Otherwise, this attribute is set to NULL.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a DistributionListMember object.	ObjectID

Stored Procedures

Name	Description
csp_DistributionListMemberCreate	Adds a member (user or another distribution list) to the specified DistributionList. Creates a new DistributionListMember object by inserting a new row into tbl_DistributionListMember.
csp_DistributionListMemberDelete	Deletes a DistributionListMember object from tbl_DistributionListMember as specified by the @ObjectId parameter.

Column Properties

DistributionListObjectId

Property Name	Value
Description:	The unique identifier of the DistributionList object to which this distribution list member belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.DistributionListObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberContactObjectId

Property Name	Value
Description:	The member of this distribution list. If the member is a contact, the unique identifier of the Contact object that is a member of the distribution list. Otherwise this attribute is set to NULL.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.MemberContactObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MemberUserObjectId

Property Name	Value
Description:	The member of this distribution list. If the member is a user, the unique identifier of the User object that is a member of the distribution list. Otherwise, this attribute is set to NULL.
Notes:	
Business Rules:	One of the Member* columns must have a non-NULL value while the remaining Member* columns must contain NULL.
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.MemberUserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a DistributionListMember object.
Notes:	Surrogate key for this table to facilitate membership links to more than one thing.
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_DistributionListMember.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

5.165. vw_Service

Simple view for tbl_Service
A process run as a service.

Additional Information

This table is used to keep track of the services that will be running, including the process name and information about the trace file used for the process.

Currently only used by the logging subsystem.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	AlarmCatalogId	varchar (254 characters)	Alarm catalog file name.	
	DefaultMaxTraceFileNumber	int (4 bytes)	The default value for the "MaxTraceFileNumber" column, the maximum number of trace files for this process.	
	DefaultMaxTraceFileSize	int (4 bytes)	The default value for the "MaxTraceFileSize" column, the maximum size of the trace file for this process (in MB).	
	DefaultMaxTraceStatementsPerFile	int (4 bytes)	The default value for the "MaxTraceStatementsPerFile" column, maximum number of trace statements per file.	
	Description	lvarchar (256 characters)	Description of the service.	
	DisplayName	nvarchar (64 characters)	Unitue text name of the service for display purposes.	DisplayName
	MaxTraceFileNumber	int (4 bytes)	Maximum number of trace files for this process.	
	MaxTraceFileSize	int (4 bytes)	Maximum size of the trace file for this process (in MB).	
	MaxTraceStatementsPerFile	int (4 bytes)	Maximum number of trace statements per file.	
PK	ObjectId	char (36 characters)	Unique identifier for this service.	ObjectID
	ProcessName	varchar (254 characters)	Name of process.	

Stored Procedures

Name	Description
csp_ServiceModify	Updates the attributes of a Service object based on the values passed in via the parameters. The @ObjectId parameter identifies the Service object that is updated.

Column Properties

AlarmCatalogId

Property Name	Value
Description:	Alarm catalog file name.
Notes:	
Business Rules:	A value of NULL indicates that the default catalog name from configuration data should be used.
Developer Notes:	
Table/Column Mapping:	tbl_Service.AlarmCatalogId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultMaxTraceFileNumber

Property Name	Value
Description:	The default value for the "MaxTraceFileNumber" column, the maximum number of trace files for this process.
Notes:	This is used to reset "MaxTraceFileNumber" to its default value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.DefaultMaxTraceFileNumber
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultMaxTraceFileSize

Property Name	Value
Description:	The default value for the "MaxTraceFileSize" column, the maximum size of the trace file for this process (in MB).
Notes:	This is used to reset "MaxTraceFileSize" to its default value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.DefaultMaxTraceFileSize
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DefaultMaxTraceStatementsPerFile

Property Name	Value
Description:	The default value for the "MaxTraceStatementsPerFile" column, maximum number of trace statements per file.
Notes:	This is used to reset "MaxTraceStatementsPerFile" to its default value.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.DefaultMaxTraceStatementsPerFile
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Description

Property Name	Value
Description:	Description of the service.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.Description
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	Unitue text name of the service for display purposes.
Notes:	
Business Rules:	DisplayName must be unique.
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_Service.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxTraceFileNumber

Property Name	Value
Description:	Maximum number of trace files for this process.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.MaxTraceFileNumber
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxTraceFileSize

Property Name	Value
Description:	Maximum size of the trace file for this process (in MB).

Property Name	Value
Notes:	Ignored if MaxTraceStatementsPerFile is set.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.MaxTraceFileSize
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MaxTraceStatementsPerFile

Property Name	Value
Description:	Maximum number of trace statements per file.
Notes:	If this is set to a non-zero value, it overrides MaxTraceFileSize, since only one may be used.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.MaxTraceStatementsPerFile
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	Unique identifier for this service.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ProcessName

Property Name	Value
Description:	Name of process.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Service.ProcessName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	254 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.166. vw_SMPPProvider

A simple view for tbl_SMPPProvider.

A provider of Short Message Peer-To-Peer services that has been configured within Cisco Unity Connection to provide message notification for subscribers with a Short Message Service (SMS) capable device.

Additional Information

This table contains the configuration data for a SMPP (Short Message Peer-To-Peer) Provider. Configuration data for providers created by both administrator (via Cisco Unity Connection Administration) and subscriber (via CPCA) are contained here.

The Short Message Peer to Peer (SMPP) protocol is an open industry standard messaging protocol designed to simplify integration of data applications with wireless mobile networks such as GSM, TDMA, CDMA and PDC. The protocol is widely deployed in the mobile telecommunications industry. The SMPP protocol specification is freely available from www.smpp.org.

Glossary:

- * ESME - External Short Message Entity. An application communicating with SMSC
- * GSM - Global System for Mobile communication. Originally known as "Groupe de travail Spéciale pour les services Mobiles". A standard for digital cellular communications (in the process of being) adopted by over 60 countries. The GSM standard is currently used in the 900 MHz and 1800 MHz bands.
- * SME - Short Message Entity.
- * SMS - Short Message Service. A message service offered by the Global System for Mobile communication (GSM) digital cellular telephone system. Using SMS, a short alphanumeric message (160 alphanumeric characters) can be sent to a mobile phone to be displayed there, much like in an alphanumeric paging system. SMS is a store and forward service where a short message is sent via a Short Message Service Center (SMSC). The message is buffered by the GSM network until the phone becomes active.
- * SMSC - Short Message Service Center. The home of the SMPP server.

The SMPPProviderObjectId is referenced by a subscriber's SMS notification device in the NotificationDevice table.

The size of some of the columns includes a NULL terminator character. For example, source_addr has a length of 65 and a maximum length constraint of 64. The 1 character difference is to account for the NULL terminator character.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	addr_npi	smallint (2 bytes)	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	Numbering-PlanIdentity
	addr_ton	smallint (2 bytes)	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	TypeOfNumber
	address_range	nvarchar (41 characters)	A set of addresses or a single address the SMPP server uses to communicate with the Cisco Unity Connection server.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	data_coding	smallint (2 bytes)	The character set that each SMS message will be converted to when the messages are sent to the SMS device.	DataCoding
	dest_addr_npi	smallint (2 bytes)	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	Numbering-PlanIdentity
	dest_addr_ton	smallint (2 bytes)	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	TypeOfNumber
	destination_addr	nvarchar (65 characters)	The destination address of this short message.	
	esm_class	int (4 bytes)	The special message attributes (Message Mode and Message Type) associated with the short message.	
	interface_version	int (4 bytes)	The version of the SMPP protocol (e.g., v3.3 or v3.4) that the SMPP server uses to communicate with ESMEs like Cisco Unity Connection.	
	IsEnabled	smallint (2 bytes)	A flag indicating whether the SMPP is enabled and available to all applicable subscribers to use for SMS (SMPP) message notifications.	Bool
	local_addr	nvarchar (65 characters)	The IP address or hostname.	
	local_port	int (4 bytes)	The port number.	
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system generated identifier for a SMPP Provider object.	ObjectID
	Owner_LocationObjectId	char (36 characters)	The owner of this SMPP provider. If the owner is the system, the unique identifier of the LocationVMS object to which this SMPP Provider belongs. Otherwise, this attribute is set to NULL.	ObjectID
	Owner_SubscriberObjectId	char (36 characters)	The owner of this SMPP provider. If the owner is a subscriber, the unique identifier of the Subscriber object to which this SMPP Provider belongs. Otherwise, this attribute is set to NULL.	ObjectID
	password	nvarchar (9 characters)	The password (as provided by the service provider) Cisco Unity Connection uses to identify itself when communicating with the SMPP server at the SMSC.	
	priority_flag	smallint (2 bytes)	The priority level of the message.	SMSPriority-Flag
	protocol_id	int (4 bytes)	The protocol identifier.	
	registered_delivery	int (4 bytes)	Whether an SMSC delivery receipt or an SME acknowledgment is required.	
	remote_addr	nvarchar (65 characters)	The IP address or host name of the SMPP server at the SMSC.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	remote_port	int (4 bytes)	The port used by the SMPP server to connect to an ESME like Cisco Unity Connection.	
	replace_if_present_flag	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection can request the SMSC to replace a previously submitted message, that is still pending delivery. The SMSC will replace an existing message provided that the source address, destination address and service_type match the same fields in the new message.	Bool
	schedule_delivery_time	nvarchar (17 characters)	The time the short message is scheduled by the SMSC for delivery. Set to NULL for immediate message delivery.	
	service_type	nvarchar (6 characters)	The SMS Application service associated with the message.	
	sm_default_msg_id	int (4 bytes)	The short message to send from a list of predefined short messages stored in the SMSC.	
	source_addr	nvarchar (65 characters)	The IP address or hostname of the SME which originated this message.	
	source_addr_npi	smallint (2 bytes)	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	Numbering-PlanIdentity
	source_addr_ton	smallint (2 bytes)	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.	TypeOfNumber
	system_id	nvarchar (16 characters)	The name or system ID that Cisco Unity Connection uses to identify itself when communicating with the SMPP server at the SMSC.	
	system_type	nvarchar (13 characters)	The type of ESME that is communicating with the SMPP server at the SMSC. For example, an application like Cisco Unity Connection may be categorized as a "VMS" (voice mail system).	
	TextName	nvarchar (128 characters)	The unique text name of the SMPP Provider that represents the service provider in Cisco Unity Connection applications and is used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.	
	validity_period	nvarchar (17 characters)	The SMSC expiration time, after which the message should be discarded if not delivered to the destination.	

Stored Procedures

Name	Description
csp_SMPPProviderCreate	Creates a new SMPPProvider object, by inserting a new row into tbl_SMPPProvider. A SMPPProvider object contains the configuration data for a Short Message Peer-To-Peer Provider in tbl_SMPPProvider.
csp_SMPPProviderDelete	Deletes a SMPPProvider object from tbl_SMPPProvider as specified by the @ObjectId parameter.
csp_SMPPProviderModify	Updates the attributes of a SMPPProvider object based on the values passed in via the parameters. The @ObjectId parameter identifies the SMPPProvider object that is updated.

Column Properties

addr_npi

Property Name	Value
Description:	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.
Notes:	<p>Corresponds to the "addr_npi" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>The addr_ton and addr_npi values tell the SMSC how to interpret the address found in the address_range field.</p> <p>Values:</p> <ul style="list-style-type: none"> 0: Unknown 1: ISDN (E163/E164) 10: ERMES (European Radio Messaging System) 14: Internet (IP) 18: WAP (Wireless Application Protocol) Client ID 3: Data (X.121.) 4: Telex (F.69) 6: Land Mobile (E.212) 8: National 9: Private
Business Rules:	Set to zero if unknown.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.addr_npi
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	NumberingPlanIdentity
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

addr_ton

Property Name	Value
Description:	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.
Notes:	<p>Corresponds to the "addr_ton" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>The addr_ton and addr_npi values tell the SMSC how to interpret the address found in the address_range field.</p> <p>Values: 0: Unknown. 1: International. 2: National. 3: Network specific. 4: Subscriber number. 5: Alphanumeric. 6: Abbreviated.</p>
Business Rules:	Set to zero if unknown.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.addr_ton
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	TypeOfNumber
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

address_range

Property Name	Value
Description:	A set of addresses or a single address the SMPP server uses to communicate with the Cisco Unity Connection server.
Notes:	<p>Corresponds to the "address_range" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>The address_range parameter is used in the bind_receiver and bind_transceiver command to specify a set of SME addresses serviced by the ESME client. A single SME address may also be specified in the address_range parameter. Messages addressed to any destination in this range shall be routed to the ESME.</p> <p>IPv6 is not supported in version 3.4 of the SMPP Protocol.</p>
Business Rules:	<ul style="list-style-type: none"> * If a provider does not require an address, set to NULL. * It is only possible to specify a single IP address. A range of IP addresses is not allowed.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.address_range
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (41 characters)
Validation - Expression:	^[\x20-\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

data_coding

Property Name	Value
Description:	The character set that each SMS message will be converted to when the messages are sent to the SMS device.

Property Name	Value
Notes:	<p>Corresponds to the "data_coding" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>For multilingual systems, consider creating a separate SMPP provider for each character set that will be offered to subscribers.</p> <p>Values:</p> <p>0: Default Alphabet</p> <p>1: IA5/ASCII - 7-bit (Windows code page 20127 or 20105)</p> <p>14: Korean (KS C 5601) - 16-bit (Windows code page 1361 or 949). Multi-bit character set: most characters are 16 bit; some are 8 bit.</p> <p>3: Latin1 (ISO-8859-1) - 8-bit (Windows code page 28591 or 1252)</p> <p>5: Japanese (JIS) - 16-bit (Windows code page 20932 or 932). Multi-bit character set: most characters are 16 bit; some are 8 bit.</p> <p>6: Cyrillic (ISO-8859-5) - 8-bit (Windows code page 28595 or 1251).</p> <p>7: Latin/Hebrew (ISO-8859-8) - 8-bit (Windows code page 28598 or 1255).</p> <p>8: Unicode (USC2) - 16-bit.</p>
Business Rules:	If the provider does not specify a value, set to zero.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.data_coding
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	DataCoding
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

dest_addr_npi

Property Name	Value
Description:	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.

Property Name	Value
Notes:	Corresponds to the "dest_addr_npi" parameter as specified in version 3.4 of the SMPP Protocol Specification. Values: 0: Unknown 1: ISDN (E163/E164) 10: ERMES (European Radio Messaging System) 14: Internet (IP) 18: WAP (Wireless Application Protocol) Client ID 3: Data (X.121.) 4: Telex (F.69) 6: Land Mobile (E.212) 8: National 9: Private
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.dest_addr_npi
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	NumberingPlanIdentity

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

dest_addr_ton

Property Name	Value
Description:	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.

Property Name	Value
Notes:	Corresponds to the "dest_addr_ton" parameter as specified in version 3.4 of the SMPP Protocol Specification. Values: 0: Unknown. 1: International. 2: National. 3: Network specific. 4: Subscriber number. 5: Alphanumeric. 6: Abbreviated.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.dest_addr_ton
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	TypeOfNumber
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

destination_addr

Property Name	Value
Description:	The destination address of this short message.
Notes:	Corresponds to the "destination_addr" parameter as specified in version 3.4 of the SMPP Protocol Specification. For mobile terminated messages, this is the directory number of the recipient MS. An IP address is specified in "aaa.bbb.ccc.ddd" notation. IPv6 is not supported in version 3.4 of the SMPP.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.destination_addr
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	
SQL Data Type/Length:	nvarchar (65 characters)
Validation - Expression:	^[\x20-\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

esm_class

Property Name	Value
Description:	The special message attributes (Message Mode and Message Type) associated with the short message.
Notes:	<p>Corresponds to the "esm_class" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>Although several Message Modes and Message Types are defined in the SMPP Protocol, Cisco Unity Connection currently only supports the Default SMSC Mode (e.g., store and forward) and Default Message Type (i.e., normal message).</p>
Business Rules:	
Developer Notes:	<p>Cisco Unity Connection default setting is zero, which specifies:</p> <ul style="list-style-type: none"> * Message Mode: Default SMSC Message Mode (e.g., Store and Forward) * Message Type: Default Message Type (i.e., normal message) <p>This field is not currently exposed in Unity 4.x SA.</p>
Table/Column Mapping:	tbl_SMPPProvider.esm_class
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	255

interface_version

Property Name	Value
Description:	The version of the SMPP protocol (e.g., v3.3 or v3.4) that the SMPP server uses to communicate with ESMEs like Cisco Unity Connection.
Notes:	<p>Corresponds to the "interface_version" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>The following interface version values are defined: 51: (0x33) Indicates that the EMSE supports version 3.3 or earlier of the SMPP protocol: 52: (0x34) Indicates that the ESME is supporting SMPP version 3.4:</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.interface_version
Primary Key:	False
Allow Null:	False
Default Value:	52
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	255

IsEnabled

Property Name	Value
Description:	A flag indicating whether the SMPP is enabled and available to all applicable subscribers to use for SMS (SMPP) message notifications.
Notes:	<p>Values:</p> <p>0: Disabled. SMPP Provider is not available for use by subscribers.</p> <p>1: Enabled. SMPP Provider is available to all applicable subscribers to use for SMS (SMPP) message notifications.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.IsEnabled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

local_addr

Property Name	Value
Description:	The IP address or hostname.
Notes:	An IP address is specified in "aaa.bbb.ccc.ddd" notation. IPv6 is not supported in version 3.4 of the SMPP.
Business Rules:	
Developer Notes:	Cisco Unity Connection default setting is NULL. This field is not currently exposed in Unity 4.x SA.
Table/Column Mapping:	tbl_SMPPProvider.local_addr
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (65 characters)
Validation - Expression:	^[\\x20-\\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

local_port

Property Name	Value
Description:	The port number.
Notes:	
Business Rules:	
Developer Notes:	Cisco Unity Connection default setting is zero. This field is not currently exposed in Unity 4.x SA.
Table/Column Mapping:	tbl_SMPPProvider.local_port
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	9999

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system generated identifier for a SMPP Provider object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_LocationObjectId

Property Name	Value
Description:	The owner of this SMPP provider. If the owner is the system, the unique identifier of the LocationVMS object to which this SMPP Provider belongs. Otherwise, this attribute is set to NULL.

Property Name	Value
Notes:	
Business Rules:	Either Owner_LocationObjectId or Owner_SubscriberObjectId, but not both, need to be non NULL.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.Owner_LocationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Owner_SubscriberObjectId

Property Name	Value
Description:	The owner of this SMPP provider. If the owner is a subscriber, the unique identifier of the Subscriber object to which this SMPP Provider belongs. Otherwise, this attribute is set to NULL.
Notes:	
Business Rules:	Either Owner_LocationObjectId or Owner_SubscriberObjectId, but not both, need to be non NULL. A user or subscriber template cannot be the owner of a SMPPProvider.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.Owner_SubscriberObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

password

Property Name	Value
Description:	The password (as provided by the service provider) Cisco Unity Connection uses to identify itself when communicating with the SMPP server at the SMSC.
Notes:	<p>Corresponds to the "password" parameter as defined in version 3.4 of the SMPP Protocol Specification.</p> <p>The password parameter is used by the SMSC to authenticate the identity of the binding ESME. The Service Provider may require ESME's to provide a password when binding to the SMSC. This password is normally issued by the SMSC system administrator. The password parameter may also be used by the ESME to authenticate the identity of the binding SMSC (e.g. in the case of the outbind operation).</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.password
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (9 characters)
Validation - Expression:	^[\x20-\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	8 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

priority_flag

Property Name	Value
Description:	The priority level of the message.

Property Name	Value
Notes:	<p>Corresponds to the "priority_flag" parameter in version 3.4 of the SMPP Protocol Specification. Allows the originating SME to assign a priority level to the short message.</p> <p>These priority levels are applied in different networks as follows:</p> <ul style="list-style-type: none"> * Priority Level GSMa: For GSM mobile terminated, messages with priority greater than Level 0 are treated as priority when making a delivery attempt (i.e. a delivery attempt is made even when MWD is set in the HLR). <p>Cisco Unity Connection currently only supports Level 0 priority.</p> <p>Values:</p> <ul style="list-style-type: none"> 0: Level 0 (lowest) priority. 1: Level 1 priority. 2: Level 2 priority. 3: Level 3 (highest) priority.
Business Rules:	
Developer Notes:	Cisco Unity Connection default setting is zero. This field is not currently exposed in Unity 4.x SA.
Table/Column Mapping:	tbl_SMPPProvider.priority_flag
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	SMSPriorityFlag
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

protocol_id

Property Name	Value
Description:	The protocol identifier.
Notes:	<p>Corresponds to the "protocol_id" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>Network specific field:</p> <ul style="list-style-type: none"> * GSM: Set according to GSM 03.40 [GSM 03.40] * ANSI-136 (TDMA): For mobile terminated messages, this field is not used and is therefore ignored by the SMSC. For ANSI-136 mobile originated messages, the SMSC should set this value to NULL. * IS-95 (CDMA): For mobile terminated messages, this field is not used and is therefore ignored by the SMSC. For IS-95 mobile originated messages, the SMSC should set this value to NULL.

Property Name	Value
Business Rules:	
Developer Notes:	Cisco Unity Connection default setting is zero. This field is not currently exposed in Unity 4.x SA.
Table/Column Mapping:	tbl_SMPPProvider.protocol_id
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	255

registered_delivery

Property Name	Value
Description:	Whether an SMSC delivery receipt or an SME acknowledgment is required.
Notes:	<p>Corresponds to the "registered_delivery" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>Cisco Unity Connection default setting for this field is zero, which specifies:</p> <ul style="list-style-type: none"> * No SMSC delivery receipt requested * No recipient SME acknowledgement requested * No Intermediate notification requested
Business Rules:	
Developer Notes:	This field is not currently exposed in Unity 4.x SA.
Table/Column Mapping:	tbl_SMPPProvider.registered_delivery
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	255

remote_addr

Property Name	Value
Description:	The IP address or host name of the SMPP server at the SMSC.
Notes:	An IP address is specified in "aaa.bbb.ccc.ddd" notation. IPv6 is not supported in version 3.4 of the SMPP.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.remote_addr
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (65 characters)
Validation - Expression:	^[x20-\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

remote_port

Property Name	Value
Description:	The port used by the SMPP server to connect to an ESME like Cisco Unity Connection.
Notes:	When the Cisco Unity Connection server is set up behind a firewall, the TCP port must be configured to allow incoming and outgoing communication between Cisco Unity Connection and the SMPP server.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.remote_port
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0

Property Name	Value
Validation - Maximum Value:	9999

replace_if_present_flag

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection can request the SMSC to replace a previously submitted message, that is still pending delivery. The SMSC will replace an existing message provided that the source address, destination address and service_type match the same fields in the new message.
Notes:	Corresponds to the "replace_if_present_flag" parameter as specified in version 3.4 of the SMPP Protocol Specification. Values: 0: Do not replace 1: Replace existing message with submitted message
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.replace_if_present_flag
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

schedule_delivery_time

Property Name	Value
Description:	The time the short message is scheduled by the SMSC for delivery. Set to NULL for immediate message delivery.
Notes:	Corresponds to the "schedule_delivery_time" parameter as specified in version 3.4 of the SMPP Protocol Specification.
Business Rules:	
Developer Notes:	Cisco Unity Connection default setting is NULL. This field is not currently exposed in Unity 4.x SA.

Property Name	Value
Table/Column Mapping:	tbl_SMPPProvider.schedule_delivery_time
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (17 characters)
Validation - Expression:	^[\\x20-\\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

service_type

Property Name	Value
Description:	The SMS Application service associated with the message.
Notes:	<p>Corresponds to the "service_type" parameter as specified in version 3.4 of the SMPP Protocol Specification.</p> <p>Specifying the "service_type" allows an ESME such as Cisco Unity Connection to do the following:</p> <ul style="list-style-type: none"> * Use enhanced messaging services such as the replace previous notification option * Control the teleservice used on the air interface <p>SMSC's may implicitly associate a "replace if present" function from the indicated service_type in a message submission operation, i.e., the SMSC will always replace an existing message pending delivery, that has the same originating and destination address as the submitted message. For example, an SMSC can ensure that a Voice Mail System using a service_type of "VMA" has at most one outstanding notification per destination MS by automatically invoking the "replace if present" function.</p> <p>The following generic service types are defined:</p> <ul style="list-style-type: none"> * NULL - None * CMT - Cellular Messaging * CPT - Cellular Paging * VMN - Voice Mail Notification * VMA - Voice Mail Alerting * WAP - Wireless Application Protocol * USSD - Unstructured Supplementary Services Data <p>All other values are carrier specific and are defined by mutual agreement between the SMSC Service Provider and the ESME application.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.service_type
Primary Key:	False

Property Name	Value
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (6 characters)
Validation - Expression:	^[\x20-\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	5 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

sm_default_msg_id

Property Name	Value
Description:	The short message to send from a list of predefined short messages stored in the SMSC.
Notes:	Corresponds to the "sm_default_msg_id" parameter as specified in version 3.4 of the SMPP Protocol Specification.
Business Rules:	If not using a predefined SMSC short message, set to zero.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.sm_default_msg_id
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	255

source_addr

Property Name	Value
Description:	The IP address or hostname of the SME which originated this message.

Property Name	Value
Notes:	<p>Corresponds to the "source_addr" parameter as defined in version 3.4 of the SMPP Protocol Specification.</p> <p>An ESME which is implemented as a single SME address, may set this column to NULL to allow the SMSC to default the source address of the submitted message.</p> <p>An IP address is specified in "aaa.bbb.ccc.ddd" notation. IPv6 is not supported in version 3.4 of the SMPP.</p>
Business Rules:	If unknown, set to NULL.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.source_addr
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (65 characters)
Validation - Expression:	^[^x20-^x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

source_addr_npi

Property Name	Value
Description:	The numeric plan indicator that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.
Notes:	<p>Corresponds to the "source_addr_npi" parameter as defined in version 3.4 of the SMPP Protocol Specification.</p> <p>Values:</p> <ul style="list-style-type: none"> 0: Unknown 1: ISDN (E163/E164) 10: ERMES (European Radio Messaging System) 14: Internet (IP) 18: WAP (Wireless Application Protocol) Client ID 3: Data (X.121.) 4: Telex (F.69) 6: Land Mobile (E.212) 8: National 9: Private
Business Rules:	If unknown, set to zero.
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_SMPPProvider.source_addr_npi
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	NumberingPlanIdentity
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

source_addr_ton

Property Name	Value
Description:	The type of number (TON) that subscribers can use when specifying the To and From fields for SMS (SMPP) message notification in the Cisco Unity Connection Administration and the Cisco Unity Assistant.
Notes:	Corresponds to the "source_addr_ton" parameter in version 3.4 of the SMPP Protocol Specification. Values: 0: Unknown. 1: International. 2: National. 3: Network specific. 4: Subscriber number. 5: Alphanumeric. 6: Abbreviated.
Business Rules:	If unknown, set to zero.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.source_addr_ton
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	TypeOfNumber
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

system_id

Property Name	Value
Description:	The name or system ID that Cisco Unity Connection uses to identify itself when communicating with the SMPP server at the SMSC.
Notes:	Corresponds to the "system_id" parameter in version 3.4 of the SMPP Protocol Specification. The system_id parameter is used to identify an ESME or an SMSC at bind time. An ESME system_id identifies the ESME or ESME agent to the SMSC. The SMSC system_id provides an identification of the SMSC to the ESME.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.system_id
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (16 characters)
Validation - Expression:	^[\\x20-\\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	15 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

system_type

Property Name	Value
Description:	The type of ESME that is communicating with the SMPP server at the SMSC. For example, an application like Cisco Unity Connection may be categorized as a "VMS" (voice mail system).

Property Name	Value
Notes:	<p>Corresponds to the "system_type" parameter in version 3.4 of the SMPP Protocol Specification.</p> <p>The system_type parameter is used to categorize the type of ESME that is binding to the SMSC. Examples include "VMS" (voice mail system), "OTA" (over-the-air activation system), and "EMAIL" (email system). Specification of the system_type is optional - some SMSC's may not require ESME's to provide this detail. In this case, the ESME can set the system_type to NULL.</p>
Business Rules:	This field is case-sensitive. Check the SMPP configuration documentation from your service provider for the correct capitalization.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.system_type
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (13 characters)
Validation - Expression:	^[^x20-x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	12 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TextName

Property Name	Value
Description:	The unique text name of the SMPP Provider that represents the service provider in Cisco Unity Connection applications and is used when displaying entries in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The name you enter here will be listed on the Provider SMPP lists displayed on the SMS (SMPP) Message Notification pages for templates and individual subscribers in the Cisco Unity Connection Administration, as well as in the Cisco Unity Assistant.
Business Rules:	The text name must be unique.
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.TextName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[^x00-x1F\x7F]*\$

Property Name	Value
Validation - Description:	Any character (ASCII or Unicode).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

validity_period

Property Name	Value
Description:	The SMSC expiration time, after which the message should be discarded if not delivered to the destination.
Notes:	<p>Corresponds to the "validity_period" parameter in version 3.4 of the SMPP Protocol Specification.</p> <p>The validity_period can be defined in absolute time format or relative time format. The encoding of absolute and relative time format is:</p> <ul style="list-style-type: none"> * Absolute time format. This is the default format used by SMPP. Scheduled delivery times and expiry times are specified in their global UTC format, including the quarter hour offset and direction symbol '+' or '-'. * Relative time format. Relative Time can be indicated by setting the UTC orientation flag to 'R' instead of '+' or '-'. In this form, the SMSC interprets the time format as the number of years, months, days, hours, minutes and seconds from the current SMSC time. Values for tenths of seconds 't' and UTC offset 'nn' are ignored and should be set to '0' and '00' respectively. <p>For example, the following time format "020610233429000R" would be interpreted as a relative period of 2 years, 6 months, 10 days, 23 hours, 34 minutes and 29 seconds from the current SMSC time.</p> <p>Set to NULL to request the SMSC default validity period.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_SMPPProvider.validity_period
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (17 characters)
Validation - Expression:	^[\\x20-\\x7E]*\$
Validation - Description:	Any ASCII character, except non-printing characters.

5.167. vw_SmtpAddress

A simple view for tbl_Alias. Provides a list of addressable SMTP addresses including distribution lists, users, and proxy addresses in this VMS.

A unique text name for addressable objects: Users, Contacts, DistributionLists, PersonalGroups.

Additional Information

Note that even users without associated mailboxes are returned with this view.

This gives us a way to ensure that all Aliases are unique within a location.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	IsPrimary	smallint (2 bytes)	A flag indicating whether this is a primary alias. Typically used for a user.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this alias belongs.	ObjectID
	Object_ContactObjectId	char (36 characters)	The object to which this alias pertains. If the alias is for a Contact, the unique identifier of the Contact object to which this alias refers. Otherwise, this attribute is set to NULL.	ObjectID
	Object_DistributionListObjectId	char (36 characters)	The object to which this alias pertains. If the alias is for a distribution list, the unique identifier of the DistributionList object to which this alias refers. Otherwise, this attribute is set to NULL.	ObjectID
	Object_PersonalGroupObjectId	char (36 characters)	The object to which this alias pertains. If the alias is for a personal group, the unique identifier of the PersonalGroup object to which this alias refers. Otherwise, this attribute is set to NULL.	ObjectID
	Object_UserObjectId	char (36 characters)	The object to which this alias pertains. If the alias is for a user, the unique identifier of the User object to which this alias refers. Otherwise, this attribute is set to NULL.	ObjectID
	SmtpAddress	lvarchar (320 characters)	The full SMTP address for this object.	SmtpAddress

Stored Procedures

vw_SmtpAddress has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsPrimary

Property Name	Value
Description:	A flag indicating whether this is a primary alias. Typically used for a user.
Notes:	Values: 0: Not primary alias 1: Is primary alias
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Alias.IsPrimary
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this alias belongs.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Alias.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Object_ContactObjectId

Property Name	Value
Description:	The object to which this alias pertains. If the alias is for a Contact, the unique identifier of the Contact object to which this alias refers. Otherwise, this attribute is set to NULL.
Notes:	Only one Object_ *ObjectId column should contain a non-null value. All other Object_ *ObjectId columns should contain NULL.
Business Rules:	Only one of the Object_xxx columns will have a value.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Object_ContactObjectId
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Object_DistributionListObjectld

Property Name	Value
Description:	The object to which this alias pertains. If the alias is for a distribution list, the unique identifier of the DistributionList object to which this alias refers. Otherwise, this attribute is set to NULL.
Notes:	Only one Object_*Objectld column should contain a non-null value. All other Object_*Objectld columns should contain NULL.
Business Rules:	Only one of the Object_xxx columns will have a value.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Object_DistributionListObjectld
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Object_PersonalGroupObjectld

Property Name	Value
Description:	The object to which this alias pertains. If the alias is for a personal group, the unique identifier of the PersonalGroup object to which this alias refers. Otherwise, this attribute is set to NULL.

Property Name	Value
Notes:	Only one Object_*ObjectId column should contain a non-null value. All other Object_*ObjectId columns should contain NULL.
Business Rules:	Only one of the Object_xxx columns will have a value.
Developer Notes:	Personal groups get generated Alias values.
Table/Column Mapping:	tbl_Alias.Object_PersonalGroupObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Object_UserObjectId

Property Name	Value
Description:	The object to which this alias pertains. If the alias is for a user, the unique identifier of the User object to which this alias refers. Otherwise, this attribute is set to NULL.
Notes:	Only one Object_*ObjectId column should contain a non-null value. All other Object_*ObjectId columns should contain NULL.
Business Rules:	Only one of the Object_xxx columns will have a value.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Object_UserObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtpAddress

Property Name	Value
Description:	The full SMTP address for this object.
Notes:	<p>For performance, we store the SMTP address which for users, contacts, and DLs is a combination of Alias (or MailName if Alias is non-ASCII such as in the case where Alias is in Japanese) and the Location.SmtpDomain associated to which this Alias object belongs.</p> <p>The SmtpAddress for a PersonalGroup is formed differently: <UserAlias> + '_' + 'List' + '_' + <NumericId> + '@' + <Domain>. For example, if JSmith creates a PersonalGroup with NumericId of 1, the SmtpAddress would be: JSmith_List_1@cisco.com</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Alias.SmtpAddress
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	SmtpAddress
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	^([\\w\\-!#\$%&'*/+=?^\\{\\} ~]+(\\.)?[\\w\\-!#\$%&'*/+=?^\\{\\} ~]+)*@(((a-zA-Z)(\\-a-zA-Z\\d)*[a-zA-Z\\d]?\\.)+([a-zA-Z\\d])+)\\\$
Validation - Description:	<p>SMTP Address= Local-Part '@' Domain Name where Local-Part (Max size : 64)</p> <ul style="list-style-type: none"> * Uppercase and lowercase letters * The digits 0 through 9 * The characters ! # \$ % & ' * + - / = ? ^ _ ` { } ~ * The character '.' is allowed but it cannot be the first or last character in the local-part. Also there cannot be consecutive periods. For example: a..b@c is invalid. <p><domain> ::= <subdomain> " " <subdomain> ::= <label> <subdomain> "." <label> <label> ::= <letter> [[<ldh-str>] <let-dig>] <ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str> <let-dig-hyp> ::= <let-dig> "-" label must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.</p>
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.168. vw_SmtpServer

Simple view for tbl_SmtpServer table.

A Simple Mail Transport Protocol (SMTP) service. In Unity Connection, the SMTP server is used to send outbound SMTP notifications and send/receive VPIM messages to/from other messaging systems such as Cisco Unity.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	The human readable text name of the SMTP server to be used when displaying entries such as in the administrative console, e.g., Cisco Unity Connection Administrator.	
	DomainName	varchar (255 characters)	An internet-addressable SMTP domain name identifying the SMTP domain that this SMTP server services.	DomainName
	IsDefault	smallint (2 bytes)	Specifies if this is the default smtp server for this location. There can only be one default at a time. If a smtp server is set to default value 1, all other servers must be set value 0.	Bool
	IsEnabled	smallint (2 bytes)	A flag indicating whether this SMTP server is active or not. Values: 0: Not active. 1: Active	Bool
	LimitConnections	smallint (2 bytes)	A flag indicating whether the SMTP server shall limit the number of simultaneous connections. This applies to both incoming and outgoing connections. Values: 0: No limit on number of connections. 1: The maximum number of connections is limited to the value contained in ?MaxNumberConnections.?	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	LimitMessageSize	smallint (2 bytes)	A flag indicating whether the SMTP server shall limit the size of an incoming message. Values: 0: No message size limit 1: Incoming message size is limited by the value contained in ?MaxMessageSize.?	Bool
	LimitMessagesSession	smallint (2 bytes)	A flag indicating whether the SMTP server shall limit the number of incoming messages per SMTP session. Values: 0: No limit on the number of messages per SMTP session 1: The number of outgoing messages per SMTP session are limited by the value contained in ?MaxNumberMessagesSession	Bool
	LimitRecipients	smallint (2 bytes)	A flag indicating whether the SMTP sever shall limit the number of recipients for both incoming and outgoing messages. Values: 0: No limit on the number of recipients 1: The number of recipients for both incoming and outgoing messages is limited by the value contained in ?MaxNumberRecipients.?	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this SMTP server belongs. All Unity Connection SMTP servers belong to the LocationVMS. A Foreign Key to tbl_LocationVMS.ObjectId.	ObjectID
	MailRootDirectory	nvarchar (255 characters)	The root directory for mail for the SMTP server.	
	MaxMessageSizeKb	int (4 bytes)	The maximum size (in KBytes) of an incoming message. If a message exceeds this value, the message is rejected, and an NDR is sent to the sender.	
	MaxNumberConnections	int (4 bytes)	The maximum number of simultaneous connections for both incoming and outgoing connections.	
	MaxNumberMessagesSession	int (4 bytes)	The maximum number of incoming messages per SMTP session.	
	MaxNumberRecipients	int (4 bytes)	The maximum number of recipients (i.e., addresses) for both incoming and outgoing messages. For an incoming message, if the number of recipients exceeds this value, the message is rejected. For an outgoing message, if the number of recipients exceeds this value, the message will be sent to the maximum number of recipients, and then another copy of the message is sent to the remaining recipients.	

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a SMTPServer object.	ObjectID
	Port	int (4 bytes)	The TCP/IP port number on which the SMTP server listens.	

Stored Procedures

Name	Description
csp_SmtpServerCreate	Creates an entry for an SMTP server that exists at this location.
csp_SmtpServerDelete	Deletes an SMTP server entry for this location.
csp_SmtpServerModify	Modifies an entry for an SMTP server that exists at this location.

Column Properties

DisplayName

Property Name	Value
Description:	The human readable text name of the SMTP server to be used when displaying entries such as in the administrative console, e.g., Cisco Unity Connection Administrator.

5.169. vw_StreamFile

A simple view for tbl_StreamFile.

A name reference to a file (stream file) that contains the recorded audio for a greeting or voice name used in Cisco Unity Connection. This will normally be the name of a WAV file, and is a relative path - the complete path is stored in the configuration table.

Additional Information

When the Cisco Unity Connection conversation needs to play a voice name or greeting, it fetches the name of the file from this table.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	FileName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a StreamFile object.	ObjectID
	TimeDeleted	smalldatetime (4 bytes)	The date and time at which the deletion of the actual stream file containing the audio is schedule to be deleted or was deleted. Otherwise, this attribute is set to NULL.	

Stored Procedures

Name	Description
csp_AllocateVoiceFile	Allocates a voice file that can be used for voice names and greetings by creating a new StreamFile object in tbl_StreamFile.
csp_StreamFileDelete	Deletes a StreamFile object from tbl_StreamFile as specified by the @ObjectId parameter. The delete doesn't actually remove the row. It simply marks it for delete by setting the TimeDeleted column to the current date/time. The SysAgent service deletes the actual row once the file is deleted from the file system.
csp_StreamFileModify	Activates an existing StreamFile object in tbl_StreamFile that was allocated using csp_AllocateVoiceFile. This procedure sets the value of the TimeDeleted column to NULL. The @FileName parameter identifies the StreamFile object that is updated.

Column Properties

FileName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a StreamFile object.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

TimeDeleted

Property Name	Value
Description:	The date and time at which the deletion of the actual stream file containing the audio is schedule to be deleted or was deleted. Otherwise, this attribute is set to NULL.
Notes:	<p>Stream (audio/WAV) files are not stored in SQL. When an object that owns a stream file is deleted, the date and time the parent object was deleted is recorded in this column as an indication to an external process which will delete the actual file from the file system (typically \Commserver\StreamFiles).</p> <p>A background process is responsible for checking this table and performing the deletions. This eliminates the need for an extended stored procedure doing the file deletions for each table with streams. This is generally a safer and more robust approach.</p>
Business Rules:	Default is 1 hour from the current time because we don't keep the file around unless a client specifically requests so.
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.TimeDeleted
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	smalldatetime (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.170. vw_Subscriber

The subscriber view contains all users that have a voice mail subscription. It includes the user information and the associated voice mail information.

Additional Information

This view is comprised of the columns in the tbl_User and tbl_UserSubscriber tables, plus an additional column - VoiceName - that is defined in tbl_streamFile.FileName.

A user object combined with a usersubscriber object is basically the same as a "Subscriber" was in the 4.0x product. A separate object (the "CallHandler") contains instructions for handling phone calls to this person, including the DTMFID and extension assigned to the subscriber.

In Cisco Unity Connection, all subscribers will "own" a voice mailbox..

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Address	nvarchar (128 characters)	The physical address such as a house number and street name where the user is located, or with which a user is associated.	
	AddressAfterRecord	smallint (2 bytes)	A flag indicating whether the subscriber will be prompted to address message before or after it is recorded.	Bool
	AddressMode	smallint (2 bytes)	The default method the subscriber will use to address messages to other subscribers.	AddressMode
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AltFirstName	nvarchar (64 characters)	The alternate spelling of a user first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	AltLastName	nvarchar (64 characters)	The alternate spelling of a user last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	AnnounceUpcoming-Meetings	int (4 bytes)	The amount ahead of time, in minutes, that Connection will warn the subscriber of upcoming meetings when the subscriber calls into the system.	
	AssistantRowsPerPage	int (4 bytes)	This controls the number of entries to display per page for all tables in the Unity Assistant, e.g. the Private List Members table.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	BillingId	nvarchar (32 characters)	Accounting information or project code associated with this user.	
	Building	nvarchar (64 characters)	The name of the building where the user is based (e.g., SJ-21).	
	CallAnswerTimeout	int (4 bytes)	The number of rings to wait for a subscriber destination to answer before the call is forwarded to the subscriber's primary phone.	
	CallHandlerObjectId	char (36 characters)	The unique identifier of the primary CallHandler object for the subscriber.	ObjectID
	CcmId	nvarchar (128 characters)	Id of associated EndUser, ApplicationUser, or DirectoryNumber in Call Manager	
	CcmIdType	int (4 bytes)	Type of CCM user/object this id refers to (end user, application user, or directory number)	CcmIdType
	City	nvarchar (64 characters)	The name of a locality, such as a city, county or other geographic region where the user is located, or with which a user is associated.	
	ClientMatterCode	varchar (40 characters)	The client matter code to transmit to Call Manger when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call. Whether or not the CMC will be transmitted is dictated by a setting on outbound call. The subscriber's CMC is used only if the outbound call doesn't have its own CMC.	ClientMatter-Code
	ClockMode	smallint (2 bytes)	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.	ClockMode
	ConfirmationConfidenceThreshold	int (4 bytes)	Voice Recognition Confirmation Confidence Threshold	
	ConfirmDeleteDeletedMessage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single deleted message.	Bool
	ConfirmDeleteMessage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.	Bool
	ConfirmDeleteMultipleMessages	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection allows the subscriber to choose which message they want to delete or whether Cisco Unity Connection permanently deletes the specified type of messages. Changes what Cisco Unity Connection does when subscribers press 3 > 2 > 2 from the Main menu to permanently delete multiple deleted messages at once.	Bool
	ConversationName	nvarchar (64 characters)	The name of the conversation the subscriber uses to set up, send, and retrieve messages.	Conversation-Name
	ConversationTui	nvarchar (64 characters)	The name of the conversation the subscriber uses to set up, send, and retrieve messages.	Conversation-Name

Key	Name	SQL Data Type/Length	Description	Custom Type
	ConversationVui	nvarchar (64 characters)	The VUI conversation assigned to the subscriber.	Conversation-Name
	CosObjectId	char (36 characters)	The unique identifier of the COS (Class of Service) object to which this user account is associated.	ObjectId
	Country	nvarchar (2 characters)	The two-letter ISO 3166-1 country code where the user is located, or with which a user is associated.	
	CreationTime	datetime (8 bytes)	The date and time the user account was created.	
	DelayAfterGreeting	int (4 bytes)	The amount of time (in milliseconds) Cisco Unity Connection will delay after playing greeting.	
	DeletedMessage-SortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection presents deleted messages to the subscriber.	Message-SortOrder
	Department	nvarchar (64 characters)	The name or number for the department or subdivision of an organization to which a person belongs.	
	DirectoryId	lvarchar (2048 characters)	The identifier of a user in a corporate directory (such as Active Directory).	DirectoryId
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
	DtmfAccessId	nvarchar (40 characters)	The DTMF access id (i.e., extension) of the subscriber.	DtmfAccessId
	DtmfNameFirst	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name of the user. These digits are used for searching the user by name via the phone.	DtmfName
	DtmfNameFirstLast	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the user. These digits are used for searching the user by name via the phone.	DtmfName
	DtmfNameLast	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the last name of the user. These digits are used for searching the user by name via the phone.	DtmfName
	DtmfNameLastFirst	varchar (16 characters)	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the user. These digits are used for searching the user by name via the phone.	DtmfName
	EmailAddress	lvarchar (320 characters)	The primary email address of the user. Not used for incoming mail delivery - informational only.	EmailAddress

Key	Name	SQL Data Type/Length	Description	Custom Type
	EmployeeId	nvarchar (64 characters)	The numeric or alphanumeric identifier assigned to a person, typically based on order of hire or association with an organization.	
	EnableMessageLocator	smallint (2 bytes)	A flag indicating whether the message locator feature is enabled for the subscriber.	Bool
	EnablePersonalRules	smallint (2 bytes)	A flag indicating whether a subscriber's personal rules are enabled. Subscribers can use this setting to disable all personal rules at once.	Bool
	EnableTts	smallint (2 bytes)	A flag indicating whether TTS is enabled for the subscriber. Only relevant if TTS enabled in User's COS also.	Bool
	EnableVisualMessage-Locator	smallint (2 bytes)	A flag indicating whether the visual message locator feature is enabled for the subscriber.	Bool
	EnAltGreetDontRing-Phone	smallint (2 bytes)	A flag indicating whether a caller is prevented from being transferred to the subscriber phone when the subscriber alternate greeting is turned on.	Bool
	EnAltGreetPreventMsg	smallint (2 bytes)	A flag indicating whether callers can leave a message after the greeting when the subscriber alternate greeting is turned on.	Bool
	EnAltGreetPreventSkip	smallint (2 bytes)	A flag indicating whether callers can skip the greeting while it is playing when the alternate greeting is turned on.	Bool
	EncryptPrivateMessages	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection encrypts messages from the subscriber that are marked private.	Bool
	EnhancedSecurityAlias	nvarchar (50 characters)	The unique text name used to identify and authenticate the user with an RSA SecurID security system.	
	Exit_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	Exit_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	Exit_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	ExitCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that is taken when a caller exits the subscriber conversation by pressing the * key or timing out.	ObjectID
	FirstDigitTimeout	int (4 bytes)	The amount of time to wait (in milliseconds) for first digit when collecting touch tones.	
	FirstName	nvarchar (64 characters)	The first name (i.e., givenName) of this user. Not their surname nor middle name.	Name
	ForcedAuthorization-Code	varchar (40 characters)	A valid authorization code that is entered prior to extending calls to classes of dialed numbers, for example, external, toll and international calls.	ForcedAuthorizationCode
	GreetByName	smallint (2 bytes)	A flag indicating whether the subscriber hears his/her name when they log into their mailbox over the phone.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	InboxAutoRefresh	int (4 bytes)	The rate (in minutes) at which Unity Inbox performs a refresh.	
	InboxAutoResolveMessageRecipients	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection automatically resolves a recipient address entered in the To, Cc or Bcc fields to a subscriber or distribution list. Known as the "AutoResolve" feature.	Bool
	InboxMessagesPerPage	int (4 bytes)	The number of messages Unity Inbox displays in a page.	
	Initials	nvarchar (12 characters)	The initial letters of some or all of the names of this user.	
	InterdigitDelay	int (4 bytes)	The amount of time to wait (in milliseconds) for input between touch tones when collecting digits in TUI.	
	IsClockMode24Hour	smallint (2 bytes)	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.	Bool
	IsSetForVmEnrollment	smallint (2 bytes)	Temporary placeholder until IsVmEnrolled can be phased out. At that point, delete this column and rename tbl_UserSubscriber.IsVmEnrolled to IsSetForVmEnrollment.	Bool
	IsTemplate	smallint (2 bytes)	A flag indicating whether this instance of a User object is a "template" for creating new users.	Bool
	IsVmEnrolled	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the enrollment conversation (record a voice name, indicate if they are listed in the directory, etc.) for the subscriber when they login.	Bool
	JumpToMessagesOnLogin	smallint (2 bytes)	A flag indicating whether the subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.	Bool
	Language	int (4 bytes)	The preferred language of this user. For a user with a voice mailbox, it is the language in which the subscriber hears instructions played to them. If the subscriber has TTS enabled by their COS, it is the language used for TTS.	Language-Code
	LastName	nvarchar (64 characters)	The last name (i.e., surname or family name) of this user, by which a user is commonly known.	Name
	ListInDirectory	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should list the subscriber in the phone directory for outside callers.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this user belongs.	ObjectID
	MailboxDn	lvarchar (392 characters)	The distinguished name of the mailbox.	
	Manager	nvarchar (64 characters)	The name of the person who is the manager or supervisor of the user.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object Cisco Unity Connection uses for subscriber Telephone Record and Playback (TRAP) sessions and to dial MWI on or off requests when the Cisco Unity Connection system has a dual switch integration. FK to tbl_MediaSwitchObjectId	ObjectID
	MessageLocator-SortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort messages when the "Message Locator" feature is enabled.	Message-SortOrder
	MessageTypeMenu	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the message type menu when the subscriber logs on to Cisco Unity Connection over the phone.	Bool
	NewMessageSortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort new messages.	Message-SortOrder
	NewMessageStackOrder	nvarchar (7 characters)	The order in which Cisco Unity Connection plays the following types of "new" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices	MessageStack-Order
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID
	PabLastImported	datetime (8 bytes)	The date and time when the personal address book was last imported from a groupware package into the personal groups for a user.	
	PcaAddressBook-RowsPerPage	int (4 bytes)	Controls the number of matching entries the Address Book displays per page, when a search is performed. The Address Book is used across multiple PCA applications and so this setting applies globally.	
	PcaHomePage	nvarchar (256 characters)	The Home Page is the first page that is displayed after logging in to the PCA.	
	PostalCode	nvarchar (40 characters)	For users in the United States, the zip code where the user is located. For users in Canada, Mexico, and other countries, the postal code where the user is located.	
	PromptSpeed	smallint (2 bytes)	The audio speed Cisco Unity Connection uses to play back prompts to the subscriber.	
	PromptVolume	int (4 bytes)	The volume level for playback of system prompts.	Volume
	ReadOnly	smallint (2 bytes)	If set to 1 (true) user is read-only and cannot be modified.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	RecordUnknownCaller-Name	smallint (2 bytes)	A flag indicating whether a caller should be promoted to record his/her name if Unity does not receive caller id.	Bool
	RepeatMenu	int (4 bytes)	The number of times to repeat a menu in TUI.	
	RingPrimaryPhoneFirst	smallint (2 bytes)	A flag indicating whether a subscriber's primary phone should be rung before trying other destinations in a personal group.	Bool
	RouteNDRToSender	smallint (2 bytes)	A flag indicating, for an undeliverable message, whether NDR messages will appear in the subscriber's mailbox or are deleted by the system.	Bool
	SavedMessageSortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort saved messages.	Message-SortOrder
	SavedMessageStack-Order	nvarchar (7 characters)	The order in which Cisco Unity Connection plays the following types of "saved" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices	Mes-sageStack-Order
	SayAltGreetWarning	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection notifies the subscriber when they login via the phone (plays conversation) or CPCA (displays a warning banner) if their alternate greeting is turned on.	Bool
	SayAni	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the Automatic Number Identification (ANI) information during message playback for voice messages from unidentified callers.	Bool
	SayCopiedNames	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the "copied" names during message playback for a subscriber.	Bool
	SayDistributionList	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the distribution list that sends a message, if applicable.	Bool
	SayMsgNumber	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the position of each message in the stack (i.e., 'Message 1', 'Message 2', etc.) during message playback for the subscriber.	Bool
	SaySender	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the sender of a message during message playback for the subscriber.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	SaySenderExtension	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection during message playback, plays the primary extension information of the subscriber who sent the message after playing the sender's voice name.	Bool
	SayTimestampAfter	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the timestamp after it plays back each message for the subscriber.	Bool
	SayTimestampBefore	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the timestamp before it plays back each for the subscriber.	Bool
	SayTotalNew	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new messages in the subscriber mailbox.	Bool
	SayTotalNewEmail	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new e-mail messages in the subscriber mailbox.	Bool
	SayTotalNewFax	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new fax messages in the subscriber mailbox.	Bool
	SayTotalNewVoice	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new voice messages in the subscriber mailbox.	Bool
	SayTotalReceipts	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new receipts in the subscriber mailbox.	Bool
	SayTotalSaved	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of saved messages in the subscriber mailbox.	Bool
	SendBroadcastMsg	smallint (2 bytes)	A flag indicating whether the subscriber may send broadcast messages.	Bool
	SendConv	smallint (2 bytes)	Type of send conversation to use - standard or streamlined.	SendConversationType
	SkipPassword-ForKnownDevice	smallint (2 bytes)	A flag indicating whether the subscriber will be asked for his/her PIN when attempting to sign-in from a known device.	Bool
	SmtpAddress	lvvarchar (320 characters)	SMTP address	SmtpAddress

Key	Name	SQL Data Type/Length	Description	Custom Type
	SpeechCompleteTimeout	int (4 bytes)	<p>Specifies the required length of silence (in milliseconds) following user speech before the recognizer finalizes a result (either accepting it or throwing a nomatch event). The SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar.</p> <p>A long SpeechCompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechCompleteTimeout value may lead to the inappropriate break up of an utterance. Reasonable SpeechCompleteTimeout values are typically in the range of 0.3 seconds to 1.0 second. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>	
	SpeechConfidenceThreshold	int (4 bytes)	<p>When the engine matches a spoken phrase, it associates a confidence level with that conclusion. This parameter determines what confidence level should be considered a successful match. A higher value means the engine is will report fewer successful matches, but it will be more confident in the matches that it reports.</p>	
	SpeechIncompleteTimeout	int (4 bytes)	<p>Specifies the required length of silence (in milliseconds) from when the speech prior to the silence matches an active grammar, but where it is possible to speak further and still match the grammar. By contrast, the SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar and no further words can be spoken.</p> <p>A long SpeechIncompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechIncompleteTimeout value may lead to the inappropriate break up of an utterance.</p> <p>The SpeechIncompleteTimeout value is usually longer than the completetimeout value to allow users to pause mid-utterance (for example, to breathe). Note that values set for the completetimeout property are only supported if they are less than the incompletetimeout property. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>	
	SpeechSensitivity	int (4 bytes)	<p>To filter out background noise and not mistake it for speech, the engine supports a variable level of sound sensitivity. A higher value means higher sensitivity.</p>	

Key	Name	SQL Data Type/Length	Description	Custom Type
	SpeechSpeedVsAccuracy	int (4 bytes)	Tunes the engine towards Performance or Accuracy. A higher value for this setting means faster matches that may be less accurate. A lower value for this setting means more accurate matches along with more processing and higher CPU utilization.	
	Speed	smallint (2 bytes)	The audio speed Cisco Unity Connection uses to play back messages to the subscriber.	
	State	nvarchar (64 characters)	The full name of the state or province where this user is located, or with which a user is associated.	
	SynchScheduleObjectId	char (36 characters)	The unique identifier of the Schedule object to use for synchronization Calendar information from groupware (such as Exchange).	ObjectID
	TimeLastCall	datetime (8 bytes)	The date and time when the subscriber last accessed their mailbox by phone (last time they were offered messages).	
	TimeZone	int (4 bytes)	The time zone to which this user account is associated.	
	Title	nvarchar (64 characters)	The position or function of a user within an organization, such as 'Vice President.'	
	Undeletable	smallint (2 bytes)	A flag indicating whether this subscriber can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UpdateBroadcastMsg	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to update broadcast messages that are active or will be active in the future.	Bool
	UseBriefPrompts	smallint (2 bytes)	A flag indicating whether the subscriber hears brief or full phone menus when accessing Cisco Unity Connection over the phone.	Bool
	UseDefaultLanguage	smallint (2 bytes)	Set to true (1) if call handler is using default language from the location it belongs to.	Bool
	UseDefaultTimeZone	smallint (2 bytes)	Indicates if the default timezone is being used.	Bool
	UseVui	smallint (2 bytes)	A flag indicating whether the speech recognition conversation is the default conversation for the subscriber.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid
	VoiceNameRequired	smallint (2 bytes)	A flag indicating whether a recorded voice name is required for this subscriber.	Bool
	Volume	int (4 bytes)	The audio volume expressed as a percentage that Cisco Unity Connection uses to play back message.	Volume
	XferString	nvarchar (40 characters)	The alternate transfer option extension for the primary call handler for the subscriber.	DtmfAccessId

Stored Procedures

Name	Description
csp_SubscriberCreate	Creates a new voice mail user (subscriber).
csp_SubscriberDelete	Deletes a voice mail user (subscriber).
csp_SubscriberModify	Updates the attributes of a voice mail user (subscriber) based on the values passed in.

Column Properties

Address

Property Name	Value
Description:	The physical address such as a house number and street name where the user is located, or with which a user is associated.
Notes:	This address may not necessarily be the same as the address where the user receives letters or parcels (i.e. postal address). This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Address
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any ASCII or unicode character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AddressAfterRecord

Property Name	Value
Description:	A flag indicating whether the subscriber will be prompted to address message before or after it is recorded.

Property Name	Value
Notes:	Values: 0: Prompt subscriber to address message before recording. 1: Prompt subscriber to address message after recording.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AddressAfterRecord
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AddressMode

Property Name	Value
Description:	The default method the subscriber will use to address messages to other subscribers.
Notes:	Used by the conversation to determine how the conversation prompts subscribers to address messages to other subscribers. If an organization does not require first and last names be entered for their users, then this column should be set to "address by extension" for all subscribers. Note that subscribers can switch between spelling by name and addressing by extension by pressing ## over the phone, however when using spelling by name, the first and last name order can be set only by an administrator via Cisco Unity Connection Administration or a user via Cisco PCA. Subscribers can address messages over the phone by one of the following method listed below. Values: 0: Address by spelling last name and then first name. 1: Address by extension number. 2: Address by spelling first name and then last name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AddressMode
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	AddressMode
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltFirstName

Property Name	Value
Description:	The alternate spelling of a user first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user firstname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altfirstname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.AltFirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltLastName

Property Name	Value
Description:	The alternate spelling of a user last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user lastname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altlastname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.AltLastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)

Property Name	Value
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AnnounceUpcomingMeetings

Property Name	Value
Description:	The amount ahead of time, in minutes, that Connection will warn the subscriber of upcoming meetings when the subscriber calls into the system.
Notes:	When this is set to 60, the subscriber will be reminded of any upcoming meetings within the next hour. To turn off meeting reminders, set this to 0.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AnnounceUpcomingMeetings
Primary Key:	False
Allow Null:	False
Default Value:	60
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	525600

AssistantRowsPerPage

Property Name	Value
Description:	This controls the number of entries to display per page for all tables in the Unity Assistant, e.g. the Private List Members table.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AssistantRowsPerPage

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

BillingId

Property Name	Value
Description:	Accounting information or project code associated with this user.
Notes:	The BillingID can be used in report generation to group call activity for subscribers. For example, to group the call activity for all subscriber in the same department or those subscribers who are part of the same billing group on a phone system.
Business Rules:	If a BillingID exists for a user, it is logged for all phone activity for a user.
Developer Notes:	
Table/Column Mapping:	tbl_User.BillingId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (32 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any ASCII or Unicode character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Building

Property Name	Value
Description:	The name of the building where the user is based (e.g., SJ-21).

Property Name	Value
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Building
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallAnswerTimeout

Property Name	Value
Description:	The number of rings to wait for a subscriber destination to answer before the call is forwarded to the subscriber's primary phone.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled. The CFNA setting of the phone are still in effect.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.CallAnswerTimeout
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	60

CallHandlerObjectId

Property Name	Value
Description:	The unique identifier of the primary CallHandler object for the subscriber.
Notes:	The call handler determines how calls to the subscriber mailbox are handled, which greeting is played, and what options callers are given during after the greetings.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.CallHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmlId

Property Name	Value
Description:	Id of associated EndUser, ApplicationUser, or DirectoryNumber in Call Manager
Notes:	See CcmlIdType to determine what type of object this refers to.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.CcmlId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any non-printable character
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

CcmlIdType

Property Name	Value
Description:	Type of CCM user/object this id refers to (end user, application user, or directory number)
Notes:	Values: 0: End User 1: Application User (such as Unity) 2: Directory Number
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.CcmlIdType
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	CcmlIdType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

City

Property Name	Value
Description:	The name of a locality, such as a city, county or other geographic region where the user is located, or with which a user is associated.
Notes:	PA Speech Enabled Name Dialing uses 'city' as a disambiguation method when duplicate names are present.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.City
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code to transmit to Call Manger when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call. Whether or not the CMC will be transmitted is dictated by a setting on outbound call. The subscriber's CMC is used only if the outbound call doesn't have its own CMC.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ClockMode

Property Name	Value
Description:	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.
Notes:	<p>Values:</p> <p>0: The time format (12 or 24-hour) based on the 'system' setting.</p> <p>1: Message timestamps are played to the subscriber using a 12-hour clock. For example, subscribers hear 1:00 PM when listening to a timestamp for a message left at 1:00 PM.</p> <p>2: Message timestamps are played to the subscriber using a 24-hour clock. For example, subscribers hear 13:00 when listening to a timestamp for a message left at 1:00 PM.</p>
Business Rules:	

Property Name	Value
Developer Notes:	Deprecating this - use IsClockMode24Hour instead
Table/Column Mapping:	tbl_UserSubscriber.ClockMode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	ClockMode
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmationConfidenceThreshold

Property Name	Value
Description:	Voice Recognition Confirmation Confidence Threshold
Notes:	Specifies the confidence level at which the voice recognition conversation will bypass requesting confirmation from the user. For example, if the threshold value is set so that confirmations will be requested when the confidence level is low, an unclear "delete" from the user will result in the user hearing "are you sure you want to delete?" Increasing the threshold value results in more frequent confirmation requests. Set the value to 0 (zero) to never request confirmation; set to 100 to always request confirmation.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmationConfidenceThreshold
Primary Key:	False
Allow Null:	False
Default Value:	60
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

ConfirmDeleteDeletedMessage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single deleted message.
Notes:	<p>To delete a deleted message, the subscriber must belong to a class of service that allows them to retain and review deleted messages.</p> <p>Values:</p> <p>0: Cisco Unity Connection will proceed with a deletion of a single deleted message without requesting confirmation from a subscriber.</p> <p>1: Cisco Unity Connection will request confirmation from subscribers before proceeding with a deletion of a single deleted message.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteDeletedMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmDeleteMessage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.
Notes:	<p>Values:</p> <p>0: Cisco Unity Connection will not request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.</p> <p>1: Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteMessage
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmDeleteMultipleMessages

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection allows the subscriber to choose which message they want to delete or whether Cisco Unity Connection permanently deletes the specified type of messages. Changes what Cisco Unity Connection does when subscribers press 3 > 2 > 2 from the Main menu to permanently delete multiple deleted messages at once.
Notes:	<p>Values:</p> <p>0: Cisco Unity Connection does not prompt the subscriber to choose, and instead permanently deletes the type of messages you specify: either deleted voice messages or all deleted messages (voice, fax, and e-mail, as applicable).</p> <p>1: Cisco Unity Connection allows the subscriber to choose which messages they want to delete; subscriber can either delete their deleted voice messages or delete all of their deleted messages.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteMultipleMessages
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationName

Property Name	Value
Description:	The name of the conversation the subscriber uses to set up, send, and retrieve messages.
Notes:	
Business Rules:	The default value is the standard Unity TUI subscriber conversation - SubMenu.
Developer Notes:	In the Unity 4.x SA and product documentation, this column is referred to as "Conversation Style." If the column is NULL, then the standard Unity TUI conversation is assumed to be the default.
Table/Column Mapping:	tbl_UserSubscriber.ConversationTui
Primary Key:	False
Allow Null:	True
Default Value:	SubMenu
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationTui

Property Name	Value
Description:	The name of the conversation the subscriber uses to set up, send, and retrieve messages.
Notes:	
Business Rules:	The default value is the standard Unity TUI subscriber conversation - SubMenu.
Developer Notes:	In the Unity 4.x SA and product documentation, this column is referred to as "Conversation Style." If the column is NULL, then the standard Unity TUI conversation is assumed to be the default.
Table/Column Mapping:	tbl_UserSubscriber.ConversationTui
Primary Key:	False
Allow Null:	True
Default Value:	SubMenu
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationVui

Property Name	Value
Description:	The VUI conversation assigned to the subscriber.
Notes:	The "UseVui" column is the flag indicating whether the subscriber is using a Vui or Tui conversation.
Business Rules:	The default value is the VuiStart conversation.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConversationVui
Primary Key:	False
Allow Null:	True
Default Value:	VuiStart
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CosObjectId

Property Name	Value
Description:	The unique identifier of the COS (Class of Service) object to which this user account is associated.
Notes:	The Class of Service (COS) specifies the features for which a user is licensed and limits such as recording limits. See tbl_COS table for more details.
Business Rules:	A user object is not required to have a COS associated with it. For example, a user who does not have any subscriptions to services such as voice mail or PA would not have a COS.
Developer Notes:	
Table/Column Mapping:	tbl_User.CosObjectId
Primary Key:	False

Property Name	Value
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Country

Property Name	Value
Description:	The two-letter ISO 3166-1 country code where the user is located, or with which a user is associated.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Country
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (2 characters)
Validation - Expression:	^[a-zA-Z]*\$
Validation - Description:	ASCII lower or upper case alphabetical character only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the user account was created.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_User.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DelayAfterGreeting

Property Name	Value
Description:	The amount of time (in milliseconds) Cisco Unity Connection will delay after playing greeting.
Notes:	NULL indicates to use system setting for this.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.DelayAfterGreeting
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	50000

DeletedMessageSortOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection presents deleted messages to the subscriber.
Notes:	Values: 1: LIFO - sort new messages first. 2: FIFO - sort old messages first.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.DeletedMessageSortOrder
Primary Key:	False
Allow Null:	False
Default Value:	2
Custom Type:	MessageSortOrder
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Department

Property Name	Value
Description:	The name or number for the department or subdivision of an organization to which a person belongs.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Department
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DirectoryId

Property Name	Value
Description:	The identifier of a user in a corporate directory (such as Active Directory).
Notes:	Exactly what is stored here changes depending on the directory.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.DirectoryId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId
SQL Data Type/Length:	lvarchar (2048 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	<p>The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns.</p> <p>If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters

Property Name	Value
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The DTMF access id (i.e., extension) of the subscriber.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ \%\'?\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameFirst

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name of the user. These digits are used for searching the user by name via the phone.
Notes:	
Business Rules:	When the first name of the user is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_User.DtmfNameFirst
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameFirstLast

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the user. These digits are used for searching the user by name via the phone.
Notes:	The digits corresponding to the user first name are first, followed by the digits corresponding to the user last name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of either the user first or last name columns. For example, if a user name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 8424282733427439
Business Rules:	When the first or last name of the user is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_User.DtmfNameFirstLast
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameLast

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the last name of the user. These digits are used for searching the user by name via the phone.
Notes:	
Business Rules:	When the last name of the user is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_User.DtmfNameLast
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameLastFirst

Property Name	Value
Description:	The digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the user. These digits are used for searching the user by name via the phone.
Notes:	The digits corresponding to the user last name are first, followed by the digits corresponding to the user first name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of the user last or first name columns. For example, if a user name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 4274392842428273
Business Rules:	When the last name of the user is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_User.DtmfNameLastFirst
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$

Property Name	Value
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EmailAddress

Property Name	Value
Description:	The primary email address of the user. Not used for incoming mail delivery - informational only.
Notes:	Not auto-generated.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.EmailAddress
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	EmailAddress
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EmployeeId

Property Name	Value
Description:	The numeric or alphanumeric identifier assigned to a person, typically based on order of hire or association with an organization.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.EmployeeId
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableMessageLocator

Property Name	Value
Description:	A flag indicating whether the message locator feature is enabled for the subscriber.
Notes:	Values: 0: Message locator feature is disabled for subscriber 1: Message locator feature is enabled for subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableMessageLocator
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnablePersonalRules

Property Name	Value
Description:	A flag indicating whether a subscriber's personal rules are enabled. Subscribers can use this setting to disable all personal rules at once.

Property Name	Value
Notes:	Defaults to 1 (true) so that it is enabled by default, if it is enabled in COS. Values: 0: Call routing rules disabled for subscriber 1: Call routing rules enabled for subscriber
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnablePersonalRules
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableTts

Property Name	Value
Description:	A flag indicating whether TTS is enabled for the subscriber. Only relevant if TTS enabled in User's COS also.
Notes:	Defaults to 1 (true) so that it is enabled by default, if it is enabled in COS. Values: 0: TTS is disabled for the subscriber 1: TTS is enabled for the subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableTts
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableVisualMessageLocator

Property Name	Value
Description:	A flag indicating whether the visual message locator feature is enabled for the subscriber.
Notes:	The visual message locator feature presents a list of messages on the subscriber's IP phone display for the subscriber to select from visually.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableVisualMessageLocator
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetDontRingPhone

Property Name	Value
Description:	A flag indicating whether a caller is prevented from being transferred to the subscriber phone when the subscriber alternate greeting is turned on.
Notes:	<p>Values:</p> <p>0: Ring the phone.</p> <p>1: Send the caller to the alternate greeting.</p> <p>This setting overrides the subscriber setting to ring the phone.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetDontRingPhone
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetPreventMsg

Property Name	Value
Description:	A flag indicating whether callers can leave a message after the greeting when the subscriber alternate greeting is turned on.
Notes:	Values: 0: If alternate greeting is active, callers can leave a message for the subscriber 1: If alternate greeting is active, callers cannot leave a message for the subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetPreventMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetPreventSkip

Property Name	Value
Description:	A flag indicating whether callers can skip the greeting while it is playing when the alternate greeting is turned on.
Notes:	Values: 0: If alternate greeting is active, callers cannot skip the greeting 1: If alternate greeting is active, callers can skip the greeting
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetPreventSkip
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EncryptPrivateMessages

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection encrypts messages from the subscriber that are marked private.
Notes:	Values: 0: Do not encrypt private messages. 1: Encrypt private messages. This column only applies to messages marked private.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EncryptPrivateMessages
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnhancedSecurityAlias

Property Name	Value
Description:	The unique text name used to identify and authenticate the user with an RSA SecurID security system.
Notes:	The COS that the user belongs to must have Enhanced Security enabled. If the COS that the user belongs to has Enhanced Security enabled, and this column is blank, then the SignIn conversation uses the user alias column instead.
Business Rules:	
Developer Notes:	The Enhanced Security feature (i.e., RSA two-factor security) is not a requirement for Cisco Unity Connection.
Table/Column Mapping:	tbl_User.EnhancedSecurityAlias
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (50 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	50 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	<p>Values:</p> <ul style="list-style-type: none"> 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ExitCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that is taken when a caller exits the subscriber conversation by pressing the * key or timing out.
Notes:	The default value for this column should be the object id of the call action associated with sending the call to the "Opening Greeting" call handler.
Business Rules:	
Developer Notes:	This one column replaces the ExitAction, ExitObjectId and ExitObjectType columns that were in the SubscriberTemplate table prior to Unity 5.x.
Table/Column Mapping:	tbl_UserSubscriber.ExitCallActionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FirstDigitTimeout

Property Name	Value
Description:	The amount of time to wait (in milliseconds) for first digit when collecting touch tones.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.FirstDigitTimeout
Primary Key:	False
Allow Null:	False
Default Value:	5000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	500

Property Name	Value
Validation - Maximum Value:	10000

FirstName

Property Name	Value
Description:	The first name (i.e., givenName) of this user. Not their surname nor middle name.
Notes:	The firstname can be stored in the native language and character set of the system, such as Kanji characters for Japanese. This allows users to use their native language and character set for display and GUI name lookup purposes.
Business Rules:	This column is optional - not required to create a user.
Developer Notes:	
Table/Column Mapping:	tbl_User.FirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ForcedAuthorizationCode

Property Name	Value
Description:	A valid authorization code that is entered prior to extending calls to classes of dialed numbers, for example, external, toll and international calls.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ForcedAuthorizationCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ForcedAuthorizationCode
SQL Data Type/Length:	varchar (40 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

GreetByName

Property Name	Value
Description:	A flag indicating whether the subscriber hears his/her name when they log into their mailbox over the phone.
Notes:	Values: 0: Do not play the name. 1: Play the recorded voice name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.GreetByName
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

InboxAutoRefresh

Property Name	Value
Description:	The rate (in minutes) at which Unity Inbox performs a refresh.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxAutoRefresh

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	15
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	999

InboxAutoResolveMessageRecipients

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection automatically resolves a recipient address entered in the To, Cc or Bcc fields to a subscriber or distribution list. Known as the "AutoResolve" feature.
Notes:	<p>AutoResolve maps a recipient address entered in the To, Cc or Bcc fields, in any of the below supported addressing formats, to a subscriber or distribution list or private list, without requiring the intervention of the user.</p> <ul style="list-style-type: none"> * Subscriber Alias (Example: hsimpson) * Subscriber DisplayName (Example: Homer Simpson) * Subscriber LastName, FirstName (Example: Simpson, Homer) * Subscriber LastName FirstName (Example: Simpson Homer) * Subscriber FirstName, LastName (Example: Homer, Simpson) * Subscriber FirstName LastName (Example: Homer Simpson) * Subscriber Extension (Example: 46637) * DistributionList DisplayName (Example: All Subscribers - UNITY1) * DistributionList Alias (Example: allsubscribers) * DistributionList Extension (Example: 99991) * PrivateList DisplayName (Example: Unity Clients Team) * BlindAddress (Example: VPIM:101_59181, somebody@somedomain.com) <p>If AutoResolve is disabled, the user will always be prompted to resolve recipient addresses.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxAutoResolveMessageRecipients
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

InboxMessagesPerPage

Property Name	Value
Description:	The number of messages Unity Inbox displays in a page.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxMessagesPerPage
Primary Key:	False
Allow Null:	False
Default Value:	20
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

Initials

Property Name	Value
Description:	The initial letters of some or all of the names of this user.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Initials
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (12 characters)
Validation - Expression:	^[p{L}\p{Digit}`~!@#%&^&[_{} \.,']*
Validation - Description:	Any alphabetical or numeric character (ANSI or Unicode); special ASCII characters ` , ~ , ! , @ , # , \$, % , ^ , & , - , _ , ' , period, comma, and space.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	6 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

InterdigitDelay

Property Name	Value
Description:	The amount of time to wait (in milliseconds) for input between touch tones when collecting digits in TUI.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InterdigitDelay
Primary Key:	False
Allow Null:	False
Default Value:	3000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1000
Validation - Maximum Value:	10000

IsClockMode24Hour

Property Name	Value
Description:	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.

Property Name	Value
Notes:	<p>Possible Values:</p> <p>0: 12-Hour clock - The subscriber hears message timestamps in the time format of a 12-hour clock. For example, a subscriber will hear 1:00 PM when listening to the timestamp of a message left at 1:00 PM.</p> <p>1: 24-Hour clock - The subscriber hears message timestamps in the time format of a 24-hour clock. For example, a subscriber will hear 13:00 when listening to the timestamp of a message left at 1:00 PM.</p>
Business Rules:	
Developer Notes:	Previously this column contained three possible values, 12 hour, 24 hour, and a third value that signified use the system default setting. In Cisco Unity Connection, the "use system default setting" has been dropped. The 12/24 hour clock must be set for each user.
Table/Column Mapping:	tbl_UserSubscriber.IsClockMode24Hour
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsSetForVmEnrollment

Property Name	Value
Description:	Temporary placeholder until IsVmEnrolled can be phased out. At that point, delete this column and rename tbl_UserSubscriber.IsVmEnrolled to IsSetForVmEnrollment.
Notes:	<p>Values:</p> <p>0: The enrollment conversation is not played for the subscriber when they login</p> <p>1: The enrollment conversation is played for the subscriber when they login</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.IsVmEnrolled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsTemplate

Property Name	Value
Description:	A flag indicating whether this instance of a User object is a "template" for creating new users.
Notes:	Used to provide default values for selected columns when creating new users. Example: In a corporate campus environment, an administrator can create a user template for each building that is prepopulated with the address information (address, building, city, state, postalcode, timezone, etc.) for the particular building.
Business Rules:	Cannot be modified.
Developer Notes:	
Table/Column Mapping:	tbl_User.IsTemplate
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsVmEnrolled

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection plays the enrollment conversation (record a voice name, indicate if they are listed in the directory, etc.) for the subscriber when they login.
Notes:	Values: 0: The enrollment conversation is not played for the subscriber when they login 1: The enrollment conversation is played for the subscriber when they login
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_UserSubscriber.IsVmEnrolled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

JumpToMessagesOnLogin

Property Name	Value
Description:	A flag indicating whether the subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.
Notes:	<p>Subscribers will not hear message counts, their own name, top level menus, etc when this setting is active.</p> <p>Values: 0: Subscriber conversation does not jump directly to first message in the message stack after subscriber sign-in. 1: Subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.JumpToMessagesOnLogin
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Language

Property Name	Value
Description:	The preferred language of this user. For a user with a voice mailbox, it is the language in which the subscriber hears instructions played to them. If the subscriber has TTS enabled by their COS, it is the language used for TTS.

Property Name	Value
Notes:	<p>NULL is not allowed because the subscriber language cannot be inherited. See customtype "LanguageCode" for more information.</p> <p>There is another language value for a subscriber that outside callers hear when they call this subscriber. This is set on the primary call handler for this subscriber and CAN be set to NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063 1065: Farsi 1065 1066: Vietnamese 1066 1067: Armenian 1067 1068: Azeri_Latin 1068 1069: Basque 1069</p>

ListInDirectory

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should list the subscriber in the phone directory for outside callers.

Property Name	Value
Notes:	If the user is listed in the phone directory AND has a recorded voice name, outside callers can find this user by spelling their name when using a directory handler (NameLookupHandler). This value has no effect on other users addressing this user by name. Values: 0: Do not list the subscriber in the phone directory. 1: List the subscriber in the phone directory.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ListInDirectory
Primary Key:	False
Allow Null:	False

Validation - Minimum Value:	
Validation - Maximum Value:	

Manager

Property Name	Value
Description:	The name of the person who is the manager or supervisor of the user.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Manager
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.

Property Name	Value
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	The unique identifier of the MediaSwitch object Cisco Unity Connection uses for subscriber Telephone Record and Playback (TRAP) sessions and to dial MWI on or off requests when the Cisco Unity Connection system has a dual switch integration. FK to tbl_MediaSwitchObjectId
Notes:	Note that for transfers, the MediaSwitchObjectId for this subscriber is stored in tbl_TransferOption and is associated with their primary call handler. For message notification, the MediaSwitchObjectId is stored in tbl_NotificationDevices.
Business Rules:	
Developer Notes:	\$\$MIGRATION: tbl_Subscriber.SwitchId
Table/Column Mapping:	tbl_UserSubscriber.MediaSwitchObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Validation - Maximum Value:	

MessageLocatorSortOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection will sort messages when the "Message Locator" feature is enabled.
Notes:	Values: 1: LIFO - sort new messages first. 2: FIFO - sort old messages first.
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.MessageLocatorSortOrder
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	MessageSortOrder
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

MessageTypeMenu

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection plays the message type menu when the subscriber logs on to Cisco Unity Connection over the phone.
Notes:	<p>The "message type" menu that subscribers will hear is "Press 1 to hear voice messages. Press 2 to hear e-mails. Press 3 to hear faxes. Press 4 to hear receipts."</p> <p>Note that although the e-mail and fax options are available in the Message Type Menu, Cisco Unity Connection plays e-mails and faxes only when the subscriber is assigned to a class of service that has the Text to Speech (TTS) and FaxMail features enabled. With fax messages, Cisco Unity Connection plays only message properties (for example, the sender, date, and time).</p> <p>Values: 0: Do not play message type menu 1: Play message type menu</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.MessageTypeMenu
Primary Key:	False
Allow Null:	False
Default Value:	0

Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

NewMessageStackOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection plays the following types of "new" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices

Property Name	Value
Notes:	<p>This column consists of a sequence of seven digits with each digit representing a specific message type.</p> <p>For example, 1352467 indicates that new messages are played in the following order: Urgent voice first, then urgent fax, urgent e-mail followed by non-urgent voice, non-urgent fax, non-urgent e-mail messages, and then lastly receipts and notices.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.NewMessageStackOrder
Primary Key:	False
Allow Null:	False
Default Value:	1234567
Custom Type:	MessageStackOrder
SQL Data Type/Length:	nvarchar (7 characters)
Validation - Expression:	[1-7]{7}
Validation - Description:	A string of seven digits consisting of digits 1-7.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	7 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a User object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

PabLastImported

Property Name	Value
Description:	The date and time when the personal address book was last imported from a groupware package into the personal groups for a user.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.PabLastImported
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

PcaAddressBookRowsPerPage

Property Name	Value
Description:	Controls the number of matching entries the Address Book displays per page, when a search is performed. The Address Book is used across multiple PCA applications and so this setting applies globally.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.PcaAddressBookRowsPerPage
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

PcaHomePage

Property Name	Value
Description:	The Home Page is the first page that is displayed after logging in to the PCA.
Notes:	In 4.05 and earlier versions, the home page is fixed. This setting allows users the flexibility to choose their home page. For example, a user may want to be taken directly to Unity Inbox after logging in, instead of the default home page that simply lists all the available applications in the PCA.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.PcaHomePage
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PostalCode

Property Name	Value
Description:	For users in the United States, the zip code where the user is located. For users in Canada, Mexico, and other countries, the postal code where the user is located.
Notes:	A specific format for zip or postal codes is not required since these items differ so widely and can change at any time. This column is for informational purposes.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.PostalCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

PromptSpeed

Property Name	Value
Description:	The audio speed Cisco Unity Connection uses to play back prompts to the subscriber.
Notes:	A value between 0 and 200 is allowed. Normal speed, the speed at which messages are recorded is a value of 100. Twice as fast as normal speed is a value of 200. Half as fast as normal speed is a value of 50.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.PromptSpeed
Primary Key:	False
Allow Null:	False
Default Value:	100
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	200

PromptVolume

Property Name	Value
Description:	The volume level for playback of system prompts.
Notes:	A value of NULL indicates to use system setting instead.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.PromptVolume
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	Volume
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

ReadOnly

Property Name	Value
Description:	If set to 1 (true) user is read-only and cannot be modified.
Notes:	Normally used only for system objects.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.ReadOnly
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RecordUnknownCallerName

Property Name	Value
Description:	A flag indicating whether a caller should be promoted to record his/her name if Unity does not receive caller id.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.RecordUnknownCallerName
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RepeatMenu

Property Name	Value
Description:	The number of times to repeat a menu in TUI.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.RepeatMenu
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	10

RingPrimaryPhoneFirst

Property Name	Value
Description:	A flag indicating whether a subscriber's primary phone should be rung before trying other destinations in a personal group.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.RingPrimaryPhoneFirst
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RouteNDRToSender

Property Name	Value
Description:	A flag indicating, for an undeliverable message, whether NDR messages will appear in the subscriber's mailbox or are deleted by the system.
Notes:	<p>Values:</p> <p>0: Cisco Unity Connection will not route an NDR to the sender's mailbox. Rather Cisco Unity Connection will delete the NDR.</p> <p>1: Cisco Unity Connection will route an NDR to the sender's mailbox when the message is undeliverable. The NDR message will be presented in the new message stack. Cisco Unity Connection will activate the MWI similar to new voice messages. Cisco Unity Connection will also notify based on subscriber notification device settings when new NDR's are present in the subscriber mailbox similar to new voice messages.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.RouteNDRToSender
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SavedMessageSortOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection will sort saved messages.
Notes:	Values: 1: LIFO - sort new messages first. 2: FIFO - sort old messages first.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SavedMessageSortOrder
Primary Key:	False
Allow Null:	False
Default Value:	2
Custom Type:	MessageSortOrder
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SavedMessageStackOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection plays the following types of "saved" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices

Property Name	Value
Notes:	<p>This column consists of a sequence of seven digits with each digit representing a specific message type.</p> <p>For example, 1352467 indicates that saved messages are played in the following order: Urgent voice first, then urgent fax, urgent e-mail followed by non-urgent voice, non-urgent fax, non-urgent e-mail messages, and then lastly receipts and notices.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SavedMessageStackOrder
Primary Key:	False
Allow Null:	False
Default Value:	1234567
Custom Type:	MessageStackOrder
SQL Data Type/Length:	nvarchar (7 characters)
Validation - Expression:	[1-7]{7}
Validation - Description:	A string of seven digits consisting of digits 1-7.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	7 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SayAltGreetWarning

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection notifies the subscriber when they login via the phone (plays conversation) or CPCA (displays a warning banner) if their alternate greeting is turned on.
Notes:	<p>Values:</p> <p>0: Do not notify the subscriber that their alternate greeting is turned on</p> <p>1- Notify the subscriber when they login if their alternate greeting is turned on</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayAltGreetWarning
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayAni

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection plays the Automatic Number Identification (ANI) information during message playback for voice messages from unidentified callers.
Notes:	<p>Note that the phone system must send Cisco Unity Connection the ANI information. If Cisco Unity Connection is connected to a phone system that does not provide ANI information, even though this setting is enabled (1), there will be no change to the conversation i.e., as if the setting is disabled.</p> <p>Values: 0: ANI information is not played. 1: ANI information is played to the user.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayAni
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayCopiedNames

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the "copied" names during message playback for a subscriber.
Notes:	<p>Values: 0: Do not announce copied names. 1: Announce copied names.</p>

Property Name	Value
Business Rules:	
Developer Notes:	It may be implemented in the future. This is intended to provide a way for subscribers to hear which other subscribers were CC'd on a particular message, if they choose.
Table/Column Mapping:	tbl_UserSubscriber.SayCopiedNames
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayDistributionList

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the distribution list that sends a message, if applicable.
Notes:	Values: 0: Do not announce the distribution list. 1: Announce the distribution list.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayDistributionList
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayMsgNumber

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the position of each message in the stack (i.e., 'Message 1', 'Message 2', etc.) during message playback for the subscriber.
Notes:	Values: 0: Do not play the message number. 1: Play the message number.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayMsgNumber
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SaySender

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the sender of a message during message playback for the subscriber.
Notes:	Values: 0: Do not announce the sender. 1: Announce the sender.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SaySender
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	

Property Name	Value
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SaySenderExtension

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection during message playback, plays the primary extension information of the subscriber who sent the message after playing the sender's voice name.
Notes:	Values: 0: Do not play the extension information of the subscriber who sent the message. 1- After playing the sender's voice name, play the primary extension information of the subscriber who sent the message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SaySenderExtension
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTimestampAfter

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the timestamp after it plays back each message for the subscriber.
Notes:	Values: 0: Do not announce the timestamp after each message is played. 1: Announce the timestamp after each message is played.
Business Rules:	Both the SayTimestampAfter and the SayTimestampBefore can be set to 1. However, this would be annoying to the subscriber. Both can also be disabled, resulting in no timestamp being played during message playback for a subscriber.

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTimestampAfter
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTimestampBefore

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the timestamp before it plays back each for the subscriber.
Notes:	Values: 0: Do not announce the timestamp before each message is played. 1: Announce the timestamp before each message is played.
Business Rules:	Both the SayTimestampAfter and the SayTimestampBefore can be set to 1. However, this would be annoying to the subscriber. Both can also be disabled, resulting in no timestamp being played during message playback for a subscriber.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTimestampBefore
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalNew

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of new messages in the subscriber mailbox.
Notes:	<p>This number includes all voice, email, fax and receipt messages as applicable (depending on the subscriber COS settings).</p> <p>Values: 0: Do not announce total number of new messages. 1: Announce the total number of new messages in the subscriber mailbox.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTotalNew
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalNewEmail

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of new e-mail messages in the subscriber mailbox.
Notes:	<p>Applies only if TTS is installed and the subscriber's COS allows for it.</p> <p>Values: 0: Do not announce total number of new e-mail messages. 1: Announce the total number of new e-mail messages in the subscriber mailbox.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTotalNewEmail
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalNewFax

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of new fax messages in the subscriber mailbox.
Notes:	Applies only if fax mail is enabled in the subscriber's COS. Values: 0: Do not announce total number of new fax messages. 1: Announce the total number of new fax messages in the subscriber mailbox.
Business Rules:	
Developer Notes:	Not in Cisco Unity Connection. Integration with 3rd-party fax applications is not supported in Cisco Unity Connection.
Table/Column Mapping:	tbl_UserSubscriber.SayTotalNewFax
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalNewVoice

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of new voice messages in the subscriber mailbox.

Property Name	Value
Notes:	Values: 0: Do not announce total number of new voice messages. 1: Announce the total number of new voice messages in the subscriber mailbox.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTotalNewVoice
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalReceipts

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of new receipts in the subscriber mailbox.
Notes:	Values: 0: Do not announce total number of new receipts. 1: Announce the total number of new receipts in the subscriber mailbox.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTotalReceipts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SayTotalSaved

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection announces the total number of saved messages in the subscriber mailbox.
Notes:	Includes all message types allowed by the subscriber COS that are marked as read in their mailbox. Values: 0: Do not announce total number of saved messages. 1: Announce the total number of saved messages in the subscriber mailbox.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SayTotalSaved
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendBroadcastMsg

Property Name	Value
Description:	A flag indicating whether the subscriber may send broadcast messages.
Notes:	Values: 0: Cannot send broadcast messages. 1: Can send broadcast messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SendBroadcastMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SendConv

Property Name	Value
Description:	Type of send conversation to use - standard or streamlined.
Notes:	Values: 0: Standard 1: Streamlined
Business Rules:	
Developer Notes:	ekostenb - changed default to StreamLined per CSCsh55132
Table/Column Mapping:	tbl_UserSubscriber.SendConv
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	SendConverationType
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SkipPasswordForKnownDevice

Property Name	Value
Description:	A flag indicating whether the subscriber will be asked for his/her PIN when attempting to sign-in from a known device.
Notes:	A "known device" is a phone number that is listed in tbl_DtmfAccessId or tbl_PhoneNumber. Values: 0: Subscriber will not be asked for their PIN when calling in from a known device. 1: Subscriber will be asked for theirr PIN when calling in from a known device.
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SkipPasswordForKnownDevice
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SmtAddress

Property Name	Value
Description:	SMTP address
Notes:	<p>For performance, we store the SMTP address which for users, contacts, and DLs is a combination of Alias (or MailName if Alias is non-ASCII such as in the case where Alias is in Japanese) and the Location.SmtDomain associated to which this Alias object belongs.</p> <p>The SmtAddress for a PersonalGroup is formed differently: <UserAlias> + '_' + 'List' + '_' + <NumericId> + '@' + <Domain>. For example, if JSmith creates a PersonalGroup with NumericId of 1, the SmtAddress would be: JSmith_List_1@cisco.com</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Alias.SmtAddress
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	SmtAddress
SQL Data Type/Length:	lvarchar (320 characters)
Validation - Expression:	^([\\w\\-!#\$%&'*/+=?^\\{\\} ~]+(\\.)?[\\w\\-!#\$%&'*/+=?^\\{\\} ~]+)*)+@(((a-zA-Z)([\\-a-zA-Z\\d]*[a-zA-Z\\d])?.)+([a-zA-Z\\d])+)\$

Property Name	Value
Validation - Description:	<p>SMTP Address= Local-Part '@' Domain Name where Local-Part (Max size : 64) * Uppercase and lowercase letters * The digits 0 through 9 * The characters ! # \$ % & ' * + - / = ? ^ _ ` { } ~ * The character '.' is allowed but it cannot be the first or last character in the local-part. Also there cannot be consecutive periods. For example: a..b@c is invalid.</p> <p><domain> ::= <subdomain> " " <subdomain> ::= <label> <subdomain> "." <label> <label> ::= <letter> [[<ldh-str>] <let-dig>] <ldh-str> ::= <let-dig-hyp> <let-dig-hyp> <ldh-str> <let-dig-hyp> ::= <let-dig> "-" label must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen.</p>
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	320 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SpeechCompleteTimeout

Property Name	Value
Description:	<p>Specifies the required length of silence (in milliseconds) following user speech before the recognizer finalizes a result (either accepting it or throwing a nomatch event). The SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar.</p> <p>A long SpeechCompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechCompleteTimeout value may lead to the inappropriate break up of an utterance. Reasonable SpeechCompleteTimeout values are typically in the range of 0.3 seconds to 1.0 second. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>
Notes:	VUI accessibility setting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SpeechCompleteTimeout
Primary Key:	False
Allow Null:	False
Default Value:	300
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	

Property Name	Value
Validation - Minimum Value:	0
Validation - Maximum Value:	50000

SpeechConfidenceThreshold

Property Name	Value
Description:	When the engine matches a spoken phrase, it associates a confidence level with that conclusion. This parameter determines what confidence level should be considered a successful match. A higher value means the engine is will report fewer successful matches, but it will be more confident in the matches that it reports.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SpeechConfidenceThreshold
Primary Key:	False
Allow Null:	False
Default Value:	45
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

SpeechIncompleteTimeout

Property Name	Value
Description:	<p>Specifies the required length of silence (in milliseconds) from when the speech prior to the silence matches an active grammar, but where it is possible to speak further and still match the grammar. By contrast, the SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar and no further words can be spoken.</p> <p>A long SpeechIncompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechIncompleteTimeout value may lead to the inappropriate break up of an utterance.</p> <p>The SpeechIncompleteTimeout value is usually longer than the completetimeout value to allow users to pause mid-utterance (for example, to breathe). Note that values set for the completetimeout property are only supported if they are less than the incompletetimeout property. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>
Notes:	VUI accessibility setting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SpeechIncompleteTimeout
Primary Key:	False
Allow Null:	False
Default Value:	750
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	300
Validation - Maximum Value:	10000

SpeechSensitivity

Property Name	Value
Description:	To filter out background noise and not mistake it for speech, the engine supports a variable level of sound sensitivity. A higher value means higher sensitivity.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SpeechSensitivity
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	

Property Name	Value
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

SpeechSpeedVsAccuracy

Property Name	Value
Description:	Tunes the engine towards Performance or Accuracy. A higher value for this setting means faster matches that may be less accurate. A lower value for this setting means more accurate matches along with more processing and higher CPU utilization.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SpeechSpeedVsAccuracy
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

Speed

Property Name	Value
Description:	The audio speed Cisco Unity Connection uses to play back messages to the subscriber.
Notes:	<p>A value between 0 and 200 is allowed.</p> <p>Normal speed, the speed at which messages are recorded is a value of 100.</p> <p>Twice as fast as normal speed is a value of 200.</p> <p>Half as fast as normal speed is a value of 50.</p>

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.Speed
Primary Key:	False
Allow Null:	False
Default Value:	100
Custom Type:	
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	200

State

Property Name	Value
Description:	The full name of the state or province where this user is located, or with which a user is associated.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.State
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

SynchScheduleObjectId

Property Name	Value
Description:	The unique identifier of the Schedule object to use for synchronization Calendar information from groupware (such as Exchange).
Notes:	Created for each subscriber at creation time. We allow NULL though, because we must create the schedule after the subscriber is created.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.SynchScheduleObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeLastCall

Property Name	Value
Description:	The date and time when the subscriber last accessed their mailbox by phone (last time they were offered messages).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.TimeLastCall
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

TimeZone

Property Name	Value
Description:	The time zone to which this user account is associated.
Notes:	<p>The TimeZone value refers to an entry in the table tbl_TimeZone.</p> <p>By default this value is NULL, which means the user is in the same time zone as the VMS on which their account resides. If, however, a user is checking messages from another time zone, this value can be set to associate them with any time zone.</p> <p>Since messages are all stored with time stamps in Universal Time Coordinated (UTC), Unity translates the times into the appropriate time zone on the fly when users are checking messages in the same way an email client does when showing you your inbox.</p>
Business Rules:	
Developer Notes:	In versions prior to Cisco Unity Connection, the bias was stored in the lower 16-bits of the integer and the upper 16-bits was reserved for an identifier.
Table/Column Mapping:	tbl_User.TimeZone
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Title

Property Name	Value
Description:	The position or function of a user within an organization, such as 'Vice President.'
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Title
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)

Property Name	Value
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Undeetable

Property Name	Value
Description:	A flag indicating whether this subscriber can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.
Notes:	Values: 0: Can be deleted 1: Cannot be deleted
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Undeetable
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UpdateBroadcastMsg

Property Name	Value
Description:	A flag indicating whether the subscriber has the ability to update broadcast messages that are active or will be active in the future.
Notes:	Values: 0: Cannot update broadcast messages. 1: Can update broadcast messages.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.UpdateBroadcastMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseBriefPrompts

Property Name	Value
Description:	A flag indicating whether the subscriber hears brief or full phone menus when accessing Cisco Unity Connection over the phone.
Notes:	Typically, as subscribers become more experienced with the system, they switch from full to brief menus to speed up the conversation. Values: 0: Turns brief menus off (full phone menus on). 1: Turns brief menus on.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.UseBriefPrompts
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultLanguage

Property Name	Value
Description:	Set to true (1) if call handler is using default language from the location it belongs to.
Notes:	Always use the Language column - if this is set, then the column Language is being derived directly from the location.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseDefaultTimeZone

Property Name	Value
Description:	Indicates if the default timezone is being used.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseVui

Property Name	Value
Description:	A flag indicating whether the speech recognition conversation is the default conversation for the subscriber.
Notes:	<p>Values:</p> <p>0: Speech recognition conversation is not default conversation for the subscriber.</p> <p>1: Speech recognition conversation is the default conversation for the subscriber.</p> <p>This is different from the VUI class of service which indicates that the subscriber is allowed to use the VUI conversation.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.UseVui
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceName

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

VoiceNameRequired

Property Name	Value
Description:	A flag indicating whether a recorded voice name is required for this subscriber.
Notes:	Set to true (1) to force subscriber to record a voice name. Values: 0: Recorded voice name not required. 1: Recorded voice name is required. Subscriber required to record a voice name at next login.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.VoiceNameRequired
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Volume

Property Name	Value
Description:	The audio volume expressed as a percentage that Cisco Unity Connection uses to play back message.

Property Name	Value
Notes:	<p>A value between 0 and 100 is allowed.</p> <p>Normal volume, the volume used to record a message is a value of 50.</p> <p>Twice as loud is a value of 100.</p> <p>Half as loud as normal volume is a value of 25.</p> <p>Note that the value is only used for message play back, not for other parts of the conversation.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.Volume
Primary Key:	False
Allow Null:	False
Default Value:	50
Custom Type:	Volume
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

XferString

Property Name	Value
Description:	The alternate transfer option extension for the primary call handler for the subscriber.
Notes:	<p>Because the primary call handler is not replicated, the transfer string is stored in the subscriber record so that the alpha directory can access it to do searches on other VMS servers in the same dialing domain and for auto attendant transfers.</p> <p>Subscribers only use the alternate contact rule so it's only necessary to access that transfer rule's extension.</p>
Business Rules:	
Developer Notes:	Not required for Cisco Unity Connection since it only supports a single VMS.
Table/Column Mapping:	tbl_UserSubscriber.XferString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-\.\@\,\;\+\ \% \? \(\)\~\ *]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.

Property Name	Value
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.171. vw_Subscriber_List

A narrow view of a user with voice mail. This view provides a list of all users who have a voice mail box, which is used by CUSA to provide list of users with voice mail in drop-down lists. It contains only the ObjectId and DisplayName for each user with voice mail.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	Subscriber alias.	Alias
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a UserSubscriber object.	ObjectID

Stored Procedures

vw_Subscriber_List has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	Subscriber alias.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	<p>The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns.</p> <p>If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a UserSubscriber object.
Notes:	This column is both the unique identifier for this table as well a reference to the ObjectId of the user to which it is associated.
Business Rules:	The value of this column is the same as the ObjectId of the user to which this object is associated.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.172. vw_Subscriber_MediaSwitchAssocCounts

For each subscriber the number of devices owned by the subscriber on each phone system, where the subscriber's extension (primary call handler) is treated as a "device."

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	User alias	Alias
	DisplayName	nvarchar (64 characters)	User display name	TextName
	MediaSwitchDisplay-Name	nvarchar (64 characters)	Phone system display name.	DisplayName
PK	MediaSwitchObjectId	char (36 characters)	Phone system unique identifier	ObjectID
	numNotificationDevice	int (4 bytes)	Number of notification devices.	
	numNotificationMWI	int (4 bytes)	Number of MWI devices.	
	numPrimaryCallHandler	int (4 bytes)	Number of primary call handlers.	
PK	ObjectId	char (36 characters)	User unique identifier	ObjectID

Stored Procedures

vw_Subscriber_MediaSwitchAssocCounts has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	User alias
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False

Property Name	Value
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	User display name
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	<p>The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns.</p> <p>If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchDisplayName

Property Name	Value
Description:	Phone system display name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MediaSwitchObjectId

Property Name	Value
Description:	Phone system unique identifier
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MediaSwitch.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

numNotificationDevice

Property Name	Value
Description:	Number of notification devices.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

numNotificationMWI

Property Name	Value
Description:	Number of MWI devices.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:

5.174. vw_Subscriber_PrimaryDtmf

A list of subscriber objects and their associated primary dtmf access ids.

Additional Information

Meant to be faster than using vw_Subscriber.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID

Stored Procedures

vw_Subscriber_PrimaryDtmf has no stored procedures.

Column Properties

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ %\?\"'()~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.

Property Name	Value
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a User object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False

5.175. vw_Subscriber_VoiceFileName

A listing of subscriber objects and their associate voicefile filenames.

Additional Information

Meant to be a faster way of getting information than joining vw_Subscriber and vw_StreamFile

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Filename	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID

Stored Procedures

vw_Subscriber_VoiceFileName has no stored procedures.

Column Properties

Filename

Property Name	Value
Description:	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.
Notes:	Clients will retrieve the path via a url, but the url-path is constructed from the file name dynamically.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_StreamFile.FileName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	FileNameGuid
SQL Data Type/Length:	varchar (40 characters)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a User object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.176. vw_SubscriberContact

A narrow view of a subscriber and system contact that consists of only those attributes necessary for message addressing.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AltFirstName	nvarchar (64 characters)	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	AltLastName	nvarchar (64 characters)	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.	AltName
	CallHandlerObjectId	char (36 characters)	The unique identifier of the primary CallHandler object for the contact.	ObjectID
	DeliveryLocationObjectId	char (36 characters)	The unique identifier of the location to which this contact's messages will be sent. Currently, this is a LocationVPIM, but in the future as we add other types of interops it could be another type of Location such as LocationOctel or LocationAMIS.	ObjectID
	DirectoryId	lvarchar (2048 characters)	The identifier of a user in a corporate directory (such as Active Directory).	DirectoryId
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	DisplayName
	DtmfAccessId	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	DtmfNameFirstLast	varchar (16 characters)	Digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the contact. These digits are used for searching the contact by name via the phone.	DtmfName

Key	Name	SQL Data Type/Length	Description	Custom Type
	DtmfNameLastFirst	varchar (16 characters)	Digits corresponding the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the contact. These digits are used for searching the contact by name via the phone.	DtmfName
	FirstName	nvarchar (64 characters)	The first name (i.e., givenName) of a contact. Not their surname nor middle name.	Name
	IsContact	int (4 bytes)	Indicates if entry is a contact (1), else it is a subscriber (0).	
	LastName	nvarchar (64 characters)	The last name (i.e., surname or family name) of a contact, by which a contact is commonly known.	Name
	ListInDirectory	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should list the contact in the phone directory for outside callers.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this contact belongs.	ObjectID
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Contact object.	ObjectID
	StreamFileObjectId	char (36 characters)	The unique identifier of the StreamFile object that represents the voice name for this contact.	ObjectID

Stored Procedures

vw_SubscriberContact has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	

Property Name	Value
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltFirstName

Property Name	Value
Description:	Alternate spelling of a contact's first name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user firstname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altfirstname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.AltFirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AltLastName

Property Name	Value
Description:	Alternate spelling of a contact's last name in an internationally recognizable format (i.e., ASCII only characters) used for TUI client name lookup and message addressing, and for VUI client name lookup.
Notes:	Used to enable name lookup and message addressing via the TUI client when the primary user lastname contains characters not supported by a touch-tone keypad. For example, if the system language is Japanese and user names are stored as Kanji characters, to enable users and callers to search for a user name via the phone, an alternate spelling of the user name in ASCII characters can be stored in the altlastname column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.AltLastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	AltName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[a-zA-Z0-9]*\$
Validation - Description:	ASCII alphabetical or numeric character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CallHandlerObjectId

Property Name	Value
Description:	The unique identifier of the primary CallHandler object for the contact.
Notes:	The call handler determines how calls to the contact are handled, which greeting is played, and what options callers are given during after the greetings.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.CallHandlerObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

DeliveryLocationObjectId

Property Name	Value
Description:	The unique identifier of the location to which this contact's messages will be sent. Currently, this is a LocationVPIM, but in the future as we add other types of interops it could be another type of Location such as LocationOctel or LocationAMIS.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DeliveryLocationObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DirectoryId

Property Name	Value
Description:	The identifier of a user in a corporate directory (such as Active Directory).
Notes:	Exactly what is stored here changes depending on the directory.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DirectoryId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DirectoryId
SQL Data Type/Length:	lvarchar (2048 characters)

Property Name	Value
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2048 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	The rule for automatically generating the displayname uses the Contact "FirstName" and "LastName" columns.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DisplayName
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfAccessId

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId

Property Name	Value
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-\.\@\,\;\+\ \%\?\(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameFirstLast

Property Name	Value
Description:	Digits corresponding to the numeric keypad mapping on a standard touchtone phone representing the first name followed by the last name of the contact. These digits are used for searching the contact by name via the phone.
Notes:	The digits corresponding to the contact first name are first, followed by the digits corresponding to the contact last name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of either the contact first or last name columns. For example, if a contact name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 8424282733427439
Business Rules:	When the first or last name of the contact is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DtmfNameFirstLast
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DtmfNameLastFirst

Property Name	Value
Description:	Digits corresponding the numeric keypad mapping on a standard touchtone phone representing the last name followed by the first name of the contact. These digits are used for searching the contact by name via the phone.
Notes:	The digits corresponding to the contact last name are first, followed by the digits corresponding to the contact first name until the maximum length of this column (16 digits) is reached. The maximum length of this column is less than either the maximum length of the contact last or first name columns. For example, if a contact name is Vibhavaree Gargeya and assuming a standard keypad mapping, this column would contain the digits: 4274392842428273
Business Rules:	When the last name of the contact is changed in this table, the DTMF spelled name is automatically recalculated.
Developer Notes:	
Table/Column Mapping:	tbl_Contact.DtmfNameLastFirst
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	DtmfName
SQL Data Type/Length:	varchar (16 characters)
Validation - Expression:	^[0-9]*\$
Validation - Description:	Numeric digits 0-9.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	16 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FirstName

Property Name	Value
Description:	The first name (i.e., givenName) of a contact. Not their surname nor middle name.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.FirstName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$

Property Name	Value
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsContact

Property Name	Value
Description:	Indicates if entry is a contact (1), else it is a subscriber (0).
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastName

Property Name	Value
Description:	The last name (i.e., surname or family name) of a contact, by which a contact is commonly known.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.LastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ListInDirectory

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should list the contact in the phone directory for outside callers.
Notes:	<p>If the contact is listed in the phone directory AND has a recorded voice name, outside callers can find this contact by spelling their name when using a directory handler (NameLookupHandler). This value has no effect on other users addressing this contact by name.</p> <p>Values: 0: Do not list the contact in the phone directory. 1: List the contact in the phone directory.</p>
Business Rules:	
Developer Notes:	Does this need to be set for GUI and TUI separately?
Table/Column Mapping:	tbl_Contact.ListInDirectory
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LocationObjectId

Property Name	Value
Description:	The unique identifier of the LocationVMS object to which this contact belongs.
Notes:	
Business Rules:	
Developer Notes:	This will always be the local VMS until we are using LocationVMS to partition the local directory.
Table/Column Mapping:	tbl_Contact.LocationObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ObjectId

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Contact object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Contact.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

StreamFileObjectId

Property Name	Value
Description:	The unique identifier of the StreamFile object that represents the voice name for this contact.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Contact.StreamFileObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.177. vw_SubscriberExternalServiceMap

Maps subscribers to external services such as IMAP, WebDAV, and Meeting Place Express.

Additional Information

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
PK	ExternalServiceObjectId	char (36 characters)	The unique identifier of the external service object to which the user is mapped.	ObjectID
	LastGuiAccessTime	datetime (8 bytes)	The last time the user accessed the external service through the GUI (e.g., CPCA, IMAP client).	
	LastTuiAccessTime	datetime (8 bytes)	The last time the user accessed the external service through the TUI.	
	LoginType	int (4 bytes)	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it).	MailboxLoginType
	SubscriberObjectId	char (36 characters)	The unique identifier of the User account object that is mapped to the external service.	ObjectID
PK	UserId	nvarchar (110 characters)	The unique text name (e.g., logon name) used by the User to logon to the service.	
	UserPassword	varchar (254 characters)	The user password for logon to the external service.	
	WebdavUrl	lvarchar (256 characters)	Relative URL for accessing user's calendar and contact information on the external service.	

Stored Procedures

Name	Description
csp_SubscriberExternalServiceMapCreate	Creates a mapping of a user with an external service such as IMAP, WebDav or MPE.
csp_SubscriberExternalServiceMapDelete	Deletes a specified mapping of an external service with a user.
csp_SubscriberExternalServiceMapModify	Updates the attributes of a specified instance of a SubscriberExternalServiceMap object based on the values passed in via the parameters.

Column Properties

ExternalServiceObjectId

Property Name	Value
Description:	The unique identifier of the external service object to which the user is mapped.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxStoreObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

LastGuiAccessTime

Property Name	Value
Description:	The last time the user accessed the external service through the GUI (e.g., CPCA, IMAP client).
Notes:	A NULL value indicates the external service has never been access via the GUI. Timestamp stored in GMT/UTC.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastGuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

LastTuiAccessTime

Property Name	Value
Description:	The last time the user accessed the external service through the TUI.
Notes:	A NULL value indicates the external service has never been access via the TUI. Timestamp stored in GMT/UTC.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastTuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LoginType

Property Name	Value
Description:	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it).
Notes:	Applies only to MPE external service currently. Default is to use the user alias. Values: 0: Users alias used for login 1: Login as guest 2: Login using mailboxid (or part of it)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxLoginType
Primary Key:	False
Allow Null:	False
Default Value:	0

Property Name	Value
Custom Type:	MailboxLoginType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the User account object that is mapped to the external service.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.UserObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserId

Property Name	Value
Description:	The unique text name (e.g., logon name) used by the User to logon to the service.
Notes:	For users with mailboxes on UMSS, the objectid of the UMSS mailbox object is contained here. For users with mailboxes on an other mail store such as Exchange or Domino, the user's legacy Exchange DN or primary SMTP address is stored here.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_MailboxMap.MailboxId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (110 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	110 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserPassword

Property Name	Value
Description:	The user password for logon to the external service.
Notes:	Encrypted/decrypted by clients.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxPassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

WebdavUrl

Property Name	Value
Description:	Relative URL for accessing user's calendar and contact information on the external service.

Property Name	Value
Notes:	This is usually a url comprised of the UserId, but that is not always the case, so it is in a separate column.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.WebdavUrl
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.178. vw_SubscriberExternalServiceMapDetail

Subscriber to External Service mapping, with added detail.

Additional Information

This view is for conversation code, primarily to help with performance.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DialString	nvarchar (40 characters)	The number dialed by Unity Connection to access the Cisco Unified MeetingPlace Express system.	PhoneNumberE123
PK	ExternalServiceObjectId	char (36 characters)	The unique identifier of the external service object to which the user is mapped.	ObjectID
	IsEnabled	smallint (2 bytes)	A flag indicating whether the external service is enabled.	Bool
	LastGuiAccessTime	datetime (8 bytes)	The last time the user accessed the external service through the GUI (e.g., CPCA, IMAP client).	
	LastTuiAccessTime	datetime (8 bytes)	The last time the user accessed the external service through the TUI.	
	LoginType	int (4 bytes)	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it).	MailboxLoginType
	RequiredSecurity	int (4 bytes)	The method of encryption that Cisco Unity Connection will use on the connection with this external service.	MailstoreConnectionEncryption
	Server	lvarchar (256 characters)	The name of the server on which the external service runs.	
	ServiceAlias	lvarchar (256 characters)	The unique text name (e.g., logon name) for a service to use to logon to the external service.	
	ServicePassword	varchar (254 characters)	The password for logon to the external service.	
	ServiceType	int (4 bytes)	The type of external service (e.g., WebDAV, IMAP, MPE).	MailboxStoreType
PK	SubscriberObjectId	char (36 characters)	The unique identifier of the User account object that is mapped to the external service.	ObjectID
PK	UserId	nvarchar (110 characters)	The unique text name (e.g., logon name) used by the User to logon to the service.	
	UserPassword	varchar (254 characters)	The user password for logon to the external service.	
	UseServiceCredentials	smallint (2 bytes)	A flag indicating whether to use service credentials rather than user credentials to logon to the external service.	Bool

Stored Procedures

vw_SubscriberExternalServiceMapDetail has no stored procedures.

Column Properties

DialString

Property Name	Value
Description:	The number dialed by Unity Connection to access the Cisco Unified MeetingPlace Express system.
Notes:	Valid only for a MeetingPlace Express external service.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.DialString
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	PhoneNumberE123
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[0-9Tt#\[*,]*\$
Validation - Description:	Digits, hash, T or t, comma, asterisk.
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ExternalServiceObjectId

Property Name	Value
Description:	The unique identifier of the external service object to which the user is mapped.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID

Property Name	Value
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

IsEnabled

Property Name	Value
Description:	A flag indicating whether the external service is enabled.
Notes:	Values: 0: The external service is disabled. 1: The external service is enabled.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Mounted
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastGuiAccessTime

Property Name	Value
Description:	The last time the user accessed the external service through the GUI (e.g., CPCA, IMAP client).
Notes:	A NULL value indicates the external service has never been access via the GUI. Timestamp stored in GMT/UTC.
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastGuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LastTuiAccessTime

Property Name	Value
Description:	The last time the user accessed the external service through the TUI.
Notes:	A NULL value indicates the external service has never been access via the TUI. Timestamp stored in GMT/UTC.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.LastTuiAccessTime
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

LoginType

Property Name	Value
Description:	Type of login to use - user alias, login as guest, or login using MailboxId (or part of it).
Notes:	Applies only to MPE external service currently. The default is to use the user alias. Values: 0: Users alias used for login 1: Login as guest 2: Login using mailboxid (or part of it)
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxLoginType
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailboxLoginType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

RequiredSecurity

Property Name	Value
Description:	The method of encryption that Cisco Unity Connection will use on the connection with this external service.
Notes:	Values: 0: No encryption. 1: TLS level encryption. 2: SSL encryption. 3: IPSec encryption.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.RequiredSecurity
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailstoreConnectionEncryption
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Server

Property Name	Value
Description:	The name of the server on which the external service runs.
Notes:	For UMSS, the server name within the VMS configuration.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.Server
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	lvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	256 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ServiceAlias

Property Name	Value
Description:	The unique text name (e.g., logon name) for a service to use to logon to the external service.
Notes:	Must have access to all users messages ("superuser").
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ServiceAlias
Primary Key:	False
Allow Null:	True
Default Value:	NULL

Property Name	Value
Custom Type:	
SQL Data Type/Length:	lvvarchar (256 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ServicePassword

Property Name	Value
Description:	The password for logon to the external service.
Notes:	Encrypted/decrypted by clients.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.ServicePassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ServiceType

Property Name	Value
Description:	The type of external service (e.g., WebDAV, IMAP, MPE).

Property Name	Value
Notes:	Values: 0: UMSS - Cisco Unity Connection message store solution. 1: IMAP - external, non-UMSS, mailstore accessed via IMAP. 2: POP3 - external, non-UMSS, mailstore accessed via POP3. 3: WebDAV - used to retrieve personal contacts (although could potentially be used to get messages) 4: Used by the Common Calendaring Library to retrieve calendaring and meeting information from the Meeting Place Express web service.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.MailboxStoreType
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	MailboxStoreType
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

SubscriberObjectId

Property Name	Value
Description:	The unique identifier of the User account object that is mapped to the external service.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

UserId

Property Name	Value
Description:	The unique text name (e.g., logon name) used by the User to logon to the service.
Notes:	For users with mailboxes on UMSS, the objectid of the UMSS mailbox object is contained here. For users with mailboxes on an other mail store such as Exchange or Domino, the user's legacy Exchange DN or primary SMTP address is stored here.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	nvarchar (110 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	110 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

UserPassword

Property Name	Value
Description:	The user password for logon to the external service.
Notes:	Encrypted/decrypted by clients.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxMap.MailboxPassword
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	varchar (254 characters)
Validation - Expression:	

Property Name	Value
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

UseServiceCredentials

Property Name	Value
Description:	A flag indicating whether to use service credentials rather than user credentials to logon to the external service.
Notes:	Values: 0: Use user credentials to logon to this external service 1: Use service credentials to logon to this external service
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_MailboxStoreMap.UseServiceCredentials
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.179. vw_SubscriberPolicy

Internal use only.

Additional Information

Quick view for the Admin team until they can handle doing their own joins

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	displayname	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
	dtmfaccessid	nvarchar (40 characters)	The dialable number.	DtmfAccessId
	firstname	nvarchar (64 characters)	The first name (i.e., givenName) of this user. Not their surname nor middle name.	Name
	lastname	nvarchar (64 characters)	The last name (i.e., surname or family name) of this user, by which a user is commonly known.	Name
PK	policyobjectid	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a Policy object.	ObjectID
	roleobjectid	char (36 characters)	The unique identifier of the Role object that specifies the privileges to be granted to the subject, for the target. For example, the role could be a "Technician."	ObjectID
	targethandlerobjectid	char (36 characters)	The unique identifier of the Handler object to which this policy applies.	ObjectID
PK	userobjectid	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID

Stored Procedures

vw_SubscriberPolicy has no stored procedures.

Column Properties

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

displayname

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.
Business Rules:	The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns. If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$

Property Name	Value
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

dtmfaccessid

Property Name	Value
Description:	The dialable number.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_DtmfAccessId.DtmfAccessId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DtmfAccessId
SQL Data Type/Length:	nvarchar (40 characters)
Validation - Expression:	^[a-zA-Z0-9\-_\.\@,;\+\\ \% \? \(\)\~*]*\$
Validation - Description:	Any valid DTMF or SIP address - see "PhoneNumber" custom type for more information.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

firstname

Property Name	Value
Description:	The first name (i.e., givenName) of this user. Not their surname nor middle name.
Notes:	The firstname can be stored in the native language and character set of the system, such as Kanji characters for Japanese. This allows users to use their native language and character set for display and GUI name lookup purposes.
Business Rules:	This column is optional - not required to create a user.
Developer Notes:	
Table/Column Mapping:	tbl_User.FirstName
Primary Key:	False
Allow Null:	True

Property Name	Value
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

lastname

Property Name	Value
Description:	The last name (i.e., surname or family name) of this user, by which a user is commonly known.
Notes:	The lastname can be stored in the native language and character set of the system, such as Kanji characters for Japanese. This allows users to use their native language and character set for display and GUI name lookup purposes.
Business Rules:	This column is optional - not required to create a user.
Developer Notes:	
Table/Column Mapping:	tbl_User.LastName
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	Name
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except for non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

policyobjectid

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a Policy object.

Property Name	Value
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_Policy.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

roleobjectid

Property Name	Value
Description:	The unique identifier of the Role object that specifies the privileges to be granted to the subject, for the target. For example, the role could be a "Technician."
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_Policy.RoleObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

targethandlerobjectid

Property Name	Value
Description:	The unique identifier of the Handler object to which this policy applies.
Notes:	
Business Rules:	Only one Target may be specified for a Policy.
Developer Notes:	
Table/Column Mapping:	tbl_Policy.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

userobjectid

Property Name	Value
Description:	The primary key for this table. A globally unique, system-generated identifier for a User object.
Notes:	
Business Rules:	Default value = newid().
Developer Notes:	
Table/Column Mapping:	tbl_User.ObjectId
Primary Key:	True
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

5.180. vw_SubscriberReference

Returns a list of objects that reference this subscriber.

Additional Information

Call Handlers and Interviews handlers can have a subscriber as a recipient. Further, in several places where we can reference a Call Handler tha can actually refer to the primary call handler of a subscriber. This view looks for both types of references.

The "objectid" column is the subscriber object id. The information returned is meant to be "human readable", so the name of the object and reference type of each reference is returned (not ObjectID).

This view is used by CUSA when deleting a user for reference substitution.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	DisplayName	nvarchar (64 characters)	Display name of object that references the subscriber.	DisplayName
PK	ObjectId	char (36 characters)	Unique identifier of the subscriber that is referenced by an object.	ObjectID
	ReferenceType	nvarchar (24 characters)	Type of reference (e.g., After Greeting, After Mesage, Routing Rule, etc.)	Subscriber-Reference-Type
	ReferrerObjectId	char (36 characters)	Unique identifier of the object that refers to the subscriber identified by the ObjectId column.	ObjectID
	ReferrerObjectType	smallint (2 bytes)	Type of the object that refers to this subscriber.	ObjectType

Stored Procedures

vw_SubscriberReference has no stored procedures.

Column Properties

DisplayName

Property Name	Value
Description:	Display name of object that references the subscriber.
Notes:	
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	A mapping to a Table/Column does NOT exist for this View column.
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	DisplayName
SQL Data Type/Length:	nvarchar (64 characters)

Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

5.181. vw_SubscriberTemplate

Provides default values for new voice mail user (subscriber) properties when creating a new voice mail user.

Additional Information

This view is comprised of the columns in the tbl_User and tbl_UserSubscriber tables, plus an additional column - VoiceName - that is defined in tbl_StreamFile.FileName.

The template also contains rules for generating names for subscribers such as display names. A subscriber template does not contain those properties that are unique to a user or that cannot be assigned en mass (user name attributes and credential, for example).

Basing new user accounts on a template minimizes the number of settings that must be modified on individual user accounts, making the job of creating users easier. It is important to note that changes to settings in a template do not affect any existing user accounts that were based on that template. Once you create users, you cannot use a template to modify them.

Business Rules

Column Summary

Key	Name	SQL Data Type/Length	Description	Custom Type
	Address	nvarchar (128 characters)	The physical address such as a house number and street name where the user is located, or with which a user is associated.	
	AddressAfterRecord	smallint (2 bytes)	A flag indicating whether the subscriber will be prompted to address message before or after it is recorded.	Bool
	AddressMode	smallint (2 bytes)	The default method the subscriber will use to address messages to other subscribers.	AddressMode
	Alias	nvarchar (64 characters)	The unique text name for either a user, distribution list, or personal group.	Alias
	AnnounceUpcoming-Meetings	int (4 bytes)	The amount ahead of time, in minutes, that Connection will warn the subscriber of upcoming meetings when the subscriber calls into the system.	
	AssistantRowsPerPage	int (4 bytes)	This controls the number of entries to display per page for all tables in the Unity Assistant, e.g. the Private List Members table.	
	BillingId	nvarchar (32 characters)	Accounting information or project code associated with this user.	
	Building	nvarchar (64 characters)	The name of the building where the user is based (e.g., SJ-21).	
	CallAnswerTimeout	int (4 bytes)	The number of rings to wait for a subscriber destination to answer before the call is forwarded to the subscriber's primary phone.	
	CallHandlerObjectId	char (36 characters)	The unique identifier of the primary CallHandler object for the subscriber.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	CantChange	smallint (2 bytes)	A flag indicating whether the user can set/change their credential (i.e., the credential specified by the associated credential policy).	Bool
	City	nvarchar (64 characters)	The name of a locality, such as a city, county or other geographic region where the user is located, or with which a user is associated.	
	ClientMatterCode	varchar (40 characters)	The client matter code to transmit to Call Manger when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call. Whether or not the CMC will be transmitted is dictated by a setting on outbound call. The subscriber's CMC is used only if the outbound call doesn't have its own CMC.	ClientMatter-Code
	ClockMode	smallint (2 bytes)	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.	ClockMode
	ConfirmationConfidenceThreshold	int (4 bytes)	Voice Recognition Confirmation Confidence Threshold	
	ConfirmDeleteDeletedMessage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single deleted message.	Bool
	ConfirmDeleteMessage	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.	Bool
	ConfirmDeleteMultipleMessages	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection allows the subscriber to choose which message they want to delete or whether Cisco Unity Connection permanently deletes the specified type of messages. Changes what Cisco Unity Connection does when subscribers press 3 > 2 > 2 from the Main menu to permanently delete multiple deleted messages at once.	Bool
	ConversationTui	nvarchar (64 characters)	The name of the conversation the subscriber uses to set up, send, and retrieve messages.	Conversation-Name
	ConversationVui	nvarchar (64 characters)	The VUI conversation assigned to the subscriber.	Conversation-Name
	CosObjectId	char (36 characters)	The unique identifier of the COS (Class of Service) object to which this user account is associated.	ObjectID
	Country	nvarchar (2 characters)	The two-letter ISO 3166-1 country code where the user is located, or with which a user is associated.	
	CreationTime	datetime (8 bytes)	The date and time the user account was created.	
	DelayAfterGreeting	int (4 bytes)	The amount of time (in milliseconds) Cisco Unity Connection will delay after playing greeting.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	DeletedMessage-SortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection presents deleted messages to the subscriber.	Message-SortOrder
	Department	nvarchar (64 characters)	The name or number for the department or subdivision of an organization to which a person belongs.	
	DisplayName	nvarchar (64 characters)	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.	TextName
	DisplayNameRule	smallint (2 bytes)	The format for generating the user display name.	Display-NameRule
	DoesntExpire	smallint (2 bytes)	A flag indicating whether or not the user credential will automatically expire (and the user required to change the credential upon its expiration) based on a defined schedule. Regardless, the user still may change the credential (if allowed by CantChange).	Bool
	EnableMessageLocator	smallint (2 bytes)	A flag indicating whether the message locator feature is enabled for the subscriber.	Bool
	EnablePersonalRules	smallint (2 bytes)	A flag indicating whether a subscriber's personal rules are enabled. Subscribers can use this setting to disable all personal rules at once.	Bool
	EnableTts	smallint (2 bytes)	A flag indicating whether TTS is enabled for the subscriber. Only relevant if TTS enabled in User's COS also.	Bool
	EnableVisualMessage-Locator	smallint (2 bytes)	A flag indicating whether the visual message locator feature is enabled for the subscriber.	Bool
	EnAltGreetDontRing-Phone	smallint (2 bytes)	A flag indicating whether a caller is prevented from being transferred to the subscriber phone when the subscriber alternate greeting is turned on.	Bool
	EnAltGreetPreventMsg	smallint (2 bytes)	A flag indicating whether callers can leave a message after the greeting when the subscriber alternate greeting is turned on.	Bool
	EnAltGreetPreventSkip	smallint (2 bytes)	A flag indicating whether callers can skip the greeting while it is playing when the alternate greeting is turned on.	Bool
	EncryptPrivateMessages	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection encrypts messages from the subscriber that are marked private.	Bool
	Exit_Action	smallint (2 bytes)	The type of call action to take, e.g., hang-up, goto another object, etc.	CallAction
	Exit_TargetConversation	nvarchar (64 characters)	The name of the conversation to which the caller is routed.	Conversation-Name
	Exit_TargetHandlerObjectId	char (36 characters)	The unique identifier of the specific object to send along to the target conversation.	ObjectID
	ExitCallActionObjectId	char (36 characters)	The unique identifier of the CallAction object that is taken when a caller exits the subscriber conversation by pressing the * key or timing out.	ObjectID

Key	Name	SQL Data Type/Length	Description	Custom Type
	FirstDigitTimeout	int (4 bytes)	The amount of time to wait (in milliseconds) for first digit when collecting touch tones.	
	ForcedAuthorization-Code	varchar (40 characters)	A valid authorization code that is entered prior to extending calls to classes of dialed numbers, for example, external, toll and international calls.	ForcedAuthorizationCode
	GreetByName	smallint (2 bytes)	A flag indicating whether the subscriber hears his/her name when they log into their mailbox over the phone.	Bool
	InboxAutoRefresh	int (4 bytes)	The rate (in minutes) at which Unity Inbox performs a refresh.	
	InboxAutoResolveMessageRecipients	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection automatically resolves a recipient address entered in the To, Cc or Bcc fields to a subscriber or distribution list. Known as the "AutoResolve" feature.	Bool
	InboxMessagesPerPage	int (4 bytes)	The number of messages Unity Inbox displays in a page.	
	InterdigitDelay	int (4 bytes)	The amount of time to wait (in milliseconds) for input between touch tones when collecting digits in TUI.	
	IsClockMode24Hour	smallint (2 bytes)	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.	Bool
	IsSetForVmEnrollment	smallint (2 bytes)	Temporary placeholder until IsVmEnrolled can be phased out. At that point, delete this column and rename tbl_UserSubscriber.IsVmEnrolled to IsSetForVmEnrollment.	Bool
	IsVmEnrolled	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the enrollment conversation (record a voice name, indicate if they are listed in the directory, etc.) for the subscriber when they login.	Bool
	JumpToMessagesOnLogin	smallint (2 bytes)	A flag indicating whether the subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.	Bool
	Language	int (4 bytes)	The preferred language of this user. For a user with a voice mailbox, it is the language in which the subscriber hears instructions played to them. If the subscriber has TTS enabled by their COS, it is the language used for TTS.	Language-Code
	ListInDirectory	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection should list the subscriber in the phone directory for outside callers.	Bool
	LocationObjectId	char (36 characters)	The unique identifier of the LocationVMS object to which this user belongs.	ObjectID
	MailboxDn	lvarchar (392 characters)	The distinguished name of the mailbox.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	MailboxStoreObjectId	char (36 characters)	The unique identifier of the MailboxStore object where a mailbox is created for a new subscriber created with this template.	ObjectID
	Manager	nvarchar (64 characters)	The name of the person who is the manager or supervisor of the user.	
	MediaSwitchObjectId	char (36 characters)	The unique identifier of the MediaSwitch object Cisco Unity Connection uses for subscriber Telephone Record and Playback (TRAP) sessions and to dial MWI on or off requests when the Cisco Unity Connection system has a dual switch integration. FK to tbl_MediaSwitchObjectId	ObjectID
	MessageAgingPolicyObjectId	char (36 characters)	The unique identifier of the MessageAgingPolicy object that applies to the mailbox created for a new subscriber created with this template.	ObjectID
	MessageLocator-SortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort messages when the "Message Locator" feature is enabled.	Message-SortOrder
	MessageTypeMenu	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the message type menu when the subscriber logs on to Cisco Unity Connection over the phone.	Bool
	NewMessageSortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort new messages.	Message-SortOrder
	NewMessageStackOrder	nvarchar (7 characters)	The order in which Cisco Unity Connection plays the following types of "new" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices	MessageStack-Order
	NotificationType	smallint (2 bytes)	The notification type to use for this mailbox created with this subscriber. See definitions under custom type - NotificationType for more details.	Notification-Type
PK	ObjectId	char (36 characters)	The primary key for this table. A globally unique, system-generated identifier for a User object.	ObjectID
	PabLastImported	datetime (8 bytes)	The date and time when the personal address book was last imported from a groupware package into the personal groups for a user.	
	PcaAddressBook-RowsPerPage	int (4 bytes)	Controls the number of matching entries the Address Book displays per page, when a search is performed. The Address Book is used across multiple PCA applications and so this setting applies globally.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	PcaHomePage	lvvarchar (256 characters)	The Home Page is the first page that is displayed after logging in to the PCA.	
	PostalCode	nvarchar (40 characters)	For users in the United States, the zip code where the user is located. For users in Canada, Mexico, and other countries, the postal code where the user is located.	
	PromptSpeed	smallint (2 bytes)	The audio speed Cisco Unity Connection uses to play back prompts to the subscriber.	
	PromptVolume	int (4 bytes)	The volume level for playback of system prompts.	Volume
	ReadOnly	smallint (2 bytes)	If set to 1 (true) user is read-only and cannot be modified.	Bool
	ReceiveQuota	int (4 bytes)	The mailbox size (in bytes) receive limit.	
	RecordUnknownCaller-Name	smallint (2 bytes)	A flag indicating whether a caller should be promoted to record his/her name if Unity does not receive caller id.	Bool
	RepeatMenu	int (4 bytes)	The number of times to repeat a menu in TUI.	
	RingPrimaryPhoneFirst	smallint (2 bytes)	A flag indicating whether a subscriber's primary phone should be rung before trying other destinations in a personal group.	Bool
	RouteNDRToSender	smallint (2 bytes)	A flag indicating, for an undeliverable message, whether NDR messages will appear in the subscriber's mailbox or are deleted by the system.	Bool
	SavedMessageSortOrder	smallint (2 bytes)	The order in which Cisco Unity Connection will sort saved messages.	Message-SortOrder
	SavedMessageStack-Order	nvarchar (7 characters)	The order in which Cisco Unity Connection plays the following types of "saved" messages: * Urgent voice messages * Non-urgent voice messages * Urgent fax messages * Non-urgent fax messages * Urgent e-mail messages * Non-urgent e-mail messages * Receipts and notices	Mes- sageStack- Order
	SayAltGreetWarning	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection notifies the subscriber when they login via the phone (plays conversation) or CPCA (displays a warning banner) if their alternate greeting is turned on.	Bool
	SayAni	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection plays the Automatic Number Identification (ANI) information during message playback for voice messages from unidentified callers.	Bool
	SayCopiedNames	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the "copied" names during message playback for a subscriber.	Bool

Key	Name	SQL Data Type/Length	Description	Custom Type
	SayDistributionList	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the distribution list that sends a message, if applicable.	Bool
	SayMsgNumber	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the position of each message in the stack (i.e., 'Message 1', 'Message 2', etc.) during message playback for the subscriber.	Bool
	SaySender	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the sender of a message during message playback for the subscriber.	Bool
	SaySenderExtension	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection during message playback, plays the primary extension information of the subscriber who sent the message after playing the sender's voice name.	Bool
	SayTimestampAfter	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the timestamp after it plays back each message for the subscriber.	Bool
	SayTimestampBefore	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the timestamp before it plays back each for the subscriber.	Bool
	SayTotalNew	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new messages in the subscriber mailbox.	Bool
	SayTotalNewEmail	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new e-mail messages in the subscriber mailbox.	Bool
	SayTotalNewFax	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new fax messages in the subscriber mailbox.	Bool
	SayTotalNewVoice	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new voice messages in the subscriber mailbox.	Bool
	SayTotalReceipts	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of new receipts in the subscriber mailbox.	Bool
	SayTotalSaved	smallint (2 bytes)	A flag indicating whether Cisco Unity Connection announces the total number of saved messages in the subscriber mailbox.	Bool
	SendBroadcastMsg	smallint (2 bytes)	A flag indicating whether the subscriber may send broadcast messages.	Bool
	SendConv	smallint (2 bytes)	Type of send conversation to use - standard or streamlined.	SendConversationType
	SendQuota	int (4 bytes)	The mailbox size (in bytes) send limit.	
	SendReadReceipts	smallint (2 bytes)	A flag indicating whether the mailbox created with this subscriber allows the system to send read receipts on its behalf.	

Key	Name	SQL Data Type/Length	Description	Custom Type
	SkipPassword-ForKnownDevice	smallint (2 bytes)	A flag indicating whether the subscriber will be asked for his/her PIN when attempting to sign-in from a known device.	Bool
	SpeechCompleteTimeout	int (4 bytes)	<p>Specifies the required length of silence (in milliseconds) following user speech before the recognizer finalizes a result (either accepting it or throwing a nomatch event). The SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar.</p> <p>A long SpeechCompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechCompleteTimeout value may lead to the inappropriate break up of an utterance. Reasonable SpeechCompleteTimeout values are typically in the range of 0.3 seconds to 1.0 second. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>	
	SpeechConfidenceThreshold	int (4 bytes)	When the engine matches a spoken phrase, it associates a confidence level with that conclusion. This parameter determines what confidence level should be considered a successful match. A higher value means the engine is will report fewer successful matches, but it will be more confident in the matches that it reports.	
	SpeechIncompleteTimeout	int (4 bytes)	<p>Specifies the required length of silence (in milliseconds) from when the speech prior to the silence matches an active grammar, but where it is possible to speak further and still match the grammar. By contrast, the SpeechCompleteTimeout property is used when the speech prior to the silence matches an active grammar and no further words can be spoken.</p> <p>A long SpeechIncompleteTimeout value delays the result completion and therefore makes the system's response slow. A short SpeechIncompleteTimeout value may lead to the inappropriate break up of an utterance.</p> <p>The SpeechIncompleteTimeout value is usually longer than the completetimeout value to allow users to pause mid-utterance (for example, to breathe). Note that values set for the completetimeout property are only supported if they are less than the incompletetimeout property. See Appendix D?Timing properties of the VoiceXML Specification for details.</p>	

Key	Name	SQL Data Type/Length	Description	Custom Type
	SpeechSensitivity	int (4 bytes)	To filter out background noise and not mistake it for speech, the engine supports a variable level of sound sensitivity. A higher value means higher sensitivity.	
	SpeechSpeedVsAccuracy	int (4 bytes)	Tunes the engine towards Performance or Accuracy. A higher value for this setting means faster matches that may be less accurate. A lower value for this setting means more accurate matches along with more processing and higher CPU utilization.	
	Speed	smallint (2 bytes)	The audio speed Cisco Unity Connection uses to play back messages to the subscriber.	
	State	nvarchar (64 characters)	The full name of the state or province where this user is located, or with which a user is associated.	
	SynchScheduleObjectId	char (36 characters)	The unique identifier of the Schedule object to use for synchronization Calendar information from groupware (such as Exchange).	ObjectID
	TimeZone	int (4 bytes)	The time zone to which this user account is associated.	
	Undeletable	smallint (2 bytes)	A flag indicating whether this subscriber can be deleted via an administrative application such as Cisco Unity Connection Administration. It is used to prevent deletion of factory defaults.	Bool
	UpdateBroadcastMsg	smallint (2 bytes)	A flag indicating whether the subscriber has the ability to update broadcast messages that are active or will be active in the future.	Bool
	UseBriefPrompts	smallint (2 bytes)	A flag indicating whether the subscriber hears brief or full phone menus when accessing Cisco Unity Connection over the phone.	Bool
	UseDefaultLanguage	smallint (2 bytes)	Set to true (1) if call handler is using default language from the location it belongs to.	Bool
	UseDefaultTimeZone	smallint (2 bytes)	Set to true (1) if the TimeZone is derived from the location to which this call handler belongs.	Bool
	UseVui	smallint (2 bytes)	A flag indicating whether the speech recognition conversation is the default conversation for the subscriber.	Bool
	VoiceName	varchar (40 characters)	The name of the WAV file containing the recorded audio (voice name, greeting, etc.) for the parent object.	FileNameGuid
	VoiceNameRequired	smallint (2 bytes)	A flag indicating whether a recorded voice name is required for this subscriber.	Bool
	Volume	int (4 bytes)	The audio volume expressed as a percentage that Cisco Unity Connection uses to play back message.	Volume
	WarningQuota	int (4 bytes)	The mailbox size (in bytes) warning limit.	

Stored Procedures

Name	Description
csp_SubscriberTemplateCreate	Creates a new Subscriber template, either from scratch or based on an existing template or user, by inserting a new row into tbl_UserSubscriber and tbl_User.
csp_SubscriberTemplateDelete	Deletes a Subscriber template from tbl_UserSubscriber as specified by the @ObjectId parameter.
csp_SubscriberTemplateModify	Updates the attributes of a Subscriber template based on the values passed in via the parameters. The @ObjectId identifies the Subscriber object in tbl_UserSubscriber that is updated.

Column Properties

Address

Property Name	Value
Description:	The physical address such as a house number and street name where the user is located, or with which a user is associated.
Notes:	This address may not necessarily be the same as the address where the user receives letters or parcels (i.e. postal address). This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Address
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (128 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any ASCII or unicode character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	128 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AddressAfterRecord

Property Name	Value
Description:	A flag indicating whether the subscriber will be prompted to address message before or after it is recorded.
Notes:	Values: 0: Prompt subscriber to address message before recording. 1: Prompt subscriber to address message after recording.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AddressAfterRecord
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

AddressMode

Property Name	Value
Description:	The default method the subscriber will use to address messages to other subscribers.
Notes:	Used by the conversation to determine how the conversation prompts subscribers to address messages to other subscribers. If an organization does not require first and last names be entered for their users, then this column should be set to "address by extension" for all subscribers. Note that subscribers can switch between spelling by name and addressing by extension by pressing ## over the phone, however when using spelling by name, the first and last name order can be set only by an administrator via Cisco Unity Connection Administration or a user via Cisco PCA. Subscribers can address messages over the phone by one of the following method listed below. Values: 0: Address by spelling last name and then first name. 1: Address by extension number. 2: Address by spelling first name and then last name.
Business Rules:	
Developer Notes:	

Property Name	Value
Table/Column Mapping:	tbl_UserSubscriber.AddressMode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	AddressMode
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Alias

Property Name	Value
Description:	The unique text name for either a user, distribution list, or personal group.
Notes:	To ensure that the Alias for a PersonalGroup is unique, it is constructed as follows: <UserAlias> + '_' + <PersonalGroupObjectId>. UserAlias is truncated to 28 characters to avoid overflow.
Business Rules:	Must be unique within a location.
Developer Notes:	
Table/Column Mapping:	tbl_Alias.Alias
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	Alias
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (ASCII and Unicode) except non-printing ASCII characters.
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

AnnounceUpcomingMeetings

Property Name	Value
Description:	The amount ahead of time, in minutes, that Connection will warn the subscriber of upcoming meetings when the subscriber calls into the system.
Notes:	When this is set to 60, the subscriber will be reminded of any upcoming meetings within the next hour. To turn off meeting reminders, set this to 0.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AnnounceUpcomingMeetings
Primary Key:	False
Allow Null:	False
Default Value:	60
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	525600

AssistantRowsPerPage

Property Name	Value
Description:	This controls the number of entries to display per page for all tables in the Unity Assistant, e.g. the Private List Members table.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.AssistantRowsPerPage
Primary Key:	False
Allow Null:	False
Default Value:	5
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

BillingId

Property Name	Value
Description:	Accounting information or project code associated with this user.
Notes:	The BillingID can be used in report generation to group call activity for subscribers. For example, to group the call activity for all subscriber in the same department or those subscribers who are part of the same billing group on a phone system.
Business Rules:	If a BillingID exists for a user, it is logged for all phone activity for a user.
Developer Notes:	
Table/Column Mapping:	tbl_User.BillingId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (32 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any ASCII or Unicode character.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	32 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Building

Property Name	Value
Description:	The name of the building where the user is based (e.g., SJ-21).
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Building
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

CallAnswerTimeout

Property Name	Value
Description:	The number of rings to wait for a subscriber destination to answer before the call is forwarded to the subscriber's primary phone.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled. The CFNA setting of the phone are still in effect.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.CallAnswerTimeout
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	60

CallHandlerObjectId

Property Name	Value
Description:	The unique identifier of the primary CallHandler object for the subscriber.
Notes:	The call handler determines how calls to the subscriber mailbox are handled, which greeting is played, and what options callers are given during after the greetings.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.CallHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	ObjectID

Property Name	Value
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CantChange

Property Name	Value
Description:	A flag indicating whether the user can set/change their credential (i.e., the credential specified by the associated credential policy).
Notes:	<p>Most organizations normally want to allow users to change their credentials. However, there are cases where this may not be desired. For example, in a scenario when more than one user has access to the same account; an administrator can set the credential, inform the users of the value of the credential, and not allow the users to change it.</p> <p>Values: 0: User is allowed to change their credential 1: User cannot change their credential</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserTemplate.CantChange
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

City

Property Name	Value
Description:	The name of a locality, such as a city, county or other geographic region where the user is located, or with which a user is associated.
Notes:	PA Speech Enabled Name Dialing uses 'city' as a disambiguation method when duplicate names are present.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.City
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ClientMatterCode

Property Name	Value
Description:	The client matter code to transmit to Call Manger when a phone number is dialed on an outbound call. The CMC is entered after a phone number is dialed so that the customer can assigning account or billing codes to the call. Whether or not the CMC will be transmitted is dictated by a setting on outbound call. The subscriber's CMC is used only if the outbound call doesn't have its own CMC.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ClientMatterCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ClientMatterCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	40 characters

Property Name	Value
Validation - Minimum Value:	
Validation - Maximum Value:	

ClockMode

Property Name	Value
Description:	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.
Notes:	<p>Values:</p> <p>0: The time format (12 or 24-hour) based on the 'system' setting.</p> <p>1: Message timestamps are played to the subscriber using a 12-hour clock. For example, subscribers hear 1:00 PM when listening to a timestamp for a message left at 1:00 PM.</p> <p>2: Message timestamps are played to the subscriber using a 24-hour clock. For example, subscribers hear 13:00 when listening to a timestamp for a message left at 1:00 PM.</p>
Business Rules:	
Developer Notes:	Deprecating this - use IsClockMode24Hour instead
Table/Column Mapping:	tbl_UserSubscriber.ClockMode
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	ClockMode
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmationConfidenceThreshold

Property Name	Value
Description:	Voice Recognition Confirmation Confidence Threshold
Notes:	<p>Specifies the confidence level at which the voice recognition conversation will bypass requesting confirmation from the user. For example, if the threshold value is set so that confirmations will be requested when the confidence level is low, an unclear "delete" from the user will result in the user hearing "are you sure you want to delete?" Increasing the threshold value results in more frequent confirmation requests.</p> <p>Set the value to 0 (zero) to never request confirmation; set to 100 to always request confirmation.</p>
Business Rules:	

Property Name	Value
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmationConfidenceThreshold
Primary Key:	False
Allow Null:	False
Default Value:	60
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	100

ConfirmDeleteDeletedMessage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single deleted message.
Notes:	<p>To delete a deleted message, the subscriber must belong to a class of service that allows them to retain and review deleted messages.</p> <p>Values:</p> <p>0: Cisco Unity Connection will proceed with a deletion of a single deleted message without requesting confirmation from a subscriber.</p> <p>1: Cisco Unity Connection will request confirmation from subscribers before proceeding with a deletion of a single deleted message.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteDeletedMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmDeleteMessage

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.
Notes:	Values: 0: Cisco Unity Connection will not request confirmation from a subscriber before proceeding with a deletion of a single new or saved message. 1: Cisco Unity Connection will request confirmation from a subscriber before proceeding with a deletion of a single new or saved message.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteMessage
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConfirmDeleteMultipleMessages

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection allows the subscriber to choose which message they want to delete or whether Cisco Unity Connection permanently deletes the specified type of messages. Changes what Cisco Unity Connection does when subscribers press 3 > 2 > 2 from the Main menu to permanently delete multiple deleted messages at once.
Notes:	Values: 0: Cisco Unity Connection does not prompt the subscriber to choose, and instead permanently deletes the type of messages you specify: either deleted voice messages or all deleted messages (voice, fax, and e-mail, as applicable). 1: Cisco Unity Connection allows the subscriber to choose which messages they want to delete; subscriber can either delete their deleted voice messages or delete all of their deleted messages.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConfirmDeleteMultipleMessages
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationTui

Property Name	Value
Description:	The name of the conversation the subscriber uses to set up, send, and retrieve messages.
Notes:	
Business Rules:	The default value is the standard Unity TUI subscriber conversation - SubMenu.
Developer Notes:	In the Unity 4.x SA and product documentation, this column is referred to as "Conversation Style." If the column is NULL, then the standard Unity TUI conversation is assumed to be the default.
Table/Column Mapping:	tbl_UserSubscriber.ConversationTui
Primary Key:	False
Allow Null:	True
Default Value:	SubMenu
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ConversationVui

Property Name	Value
Description:	The VUI conversation assigned to the subscriber.

Property Name	Value
Notes:	The "UseVui" column is the flag indicating whether the subscriber is using a Vui or Tui conversation.
Business Rules:	The default value is the VuiStart conversation.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ConversationVui
Primary Key:	False
Allow Null:	True
Default Value:	VuiStart
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CosObjectId

Property Name	Value
Description:	The unique identifier of the COS (Class of Service) object to which this user account is associated.
Notes:	The Class of Service (COS) specifies the features for which a user is licensed and limits such as recording limits. See tbl_COS table for more details.
Business Rules:	A user object is not required to have a COS associated with it. For example, a user who does not have any subscriptions to services such as voice mail or PA would not have a COS.
Developer Notes:	
Table/Column Mapping:	tbl_User.CosObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

Country

Property Name	Value
Description:	The two-letter ISO 3166-1 country code where the user is located, or with which a user is associated.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Country
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (2 characters)
Validation - Expression:	^[a-zA-Z]*\$
Validation - Description:	ASCII lower or upper case alphabetical character only.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	2 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

CreationTime

Property Name	Value
Description:	The date and time the user account was created.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.CreationTime
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	
SQL Data Type/Length:	datetime (8 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DelayAfterGreeting

Property Name	Value
Description:	The amount of time (in milliseconds) Cisco Unity Connection will delay after playing greeting.
Notes:	NULL indicates to use system setting for this.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.DelayAfterGreeting
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	0
Validation - Maximum Value:	50000

DeletedMessageSortOrder

Property Name	Value
Description:	The order in which Cisco Unity Connection presents deleted messages to the subscriber.
Notes:	Values: 1: LIFO - sort new messages first. 2: FIFO - sort old messages first.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.DeletedMessageSortOrder
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	2
Custom Type:	MessageSortOrder
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Department

Property Name	Value
Description:	The name or number for the department or subdivision of an organization to which a person belongs.
Notes:	This column is for informational purposes.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.Department
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayName

Property Name	Value
Description:	The preferred text name of a person to be used when displaying entries such as in the administrative console, e.g. Cisco Unity Connection Administration.
Notes:	The DisplayName is not used to generate the spelled names for voice mail subscriptions, the first and last names are used for that purpose.

Property Name	Value
Business Rules:	<p>The rule for automatically generating the displayname uses the User "FirstName" and "LastName" columns.</p> <p>If neither the User firstname or lastname columns are populated, the displayname shall be composed using the User "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_User.DisplayName
Primary Key:	False
Allow Null:	True
Default Value:	
Custom Type:	TextName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

DisplayNameRule

Property Name	Value
Description:	The format for generating the user display name.
Notes:	<p>If an organization uses a format other than those listed, one of these options must be used anyway, then manually adjust the display name in each user account.</p> <p>For Japanese, a value of 2 must be used.</p> <p>Values:</p> <p>1: First name, then last name.</p> <p>2: Last name, then first name.</p>
Business Rules:	<p>The rule for automatically generating the display name uses the user "FirstName" and "LastName" columns.</p> <p>If neither the user firstname or lastname columns are populated, the display name shall be composed using the user "Alias" column.</p>
Developer Notes:	
Table/Column Mapping:	tbl_UserTemplate.DisplayNameRule
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	DisplayNameRule
SQL Data Type/Length:	smallint (2 bytes)

Property Name	Value
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

DoesntExpire

Property Name	Value
Description:	A flag indicating whether or not the user credential will automatically expire (and the user required to change the credential upon its expiration) based on a defined schedule. Regardless, the user still may change the credential (if allowed by CantChange).
Notes:	<p>The scope of this setting is per credential. It enables an administrator to disable credential expiration on a per credential/user basis while maintaining a credential expiration policy for all users on the system. See tbl_Credential->DoesntExpire for more information.</p> <p>Values: 0: The user credential will automatically expire. The expiration of the credential is controlled by the value of the column tbl_CredentialPolicy->MaxDays. 1: The user credential will not automatically expire.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserTemplate.DoesntExpire
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableMessageLocator

Property Name	Value
Description:	A flag indicating whether the message locator feature is enabled for the subscriber.

Property Name	Value
Notes:	Values: 0: Message locator feature is disabled for subscriber 1: Message locator feature is enabled for subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableMessageLocator
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnablePersonalRules

Property Name	Value
Description:	A flag indicating whether a subscriber's personal rules are enabled. Subscribers can use this setting to disable all personal rules at once.
Notes:	Defaults to 1 (true) so that it is enabled by default, if it is enabled in COS. Values: 0: Call routing rules disabled for subscriber 1: Call routing rules enabled for subscriber
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnablePersonalRules
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	

Property Name	Value
Validation - Maximum Value:	

EnableTts

Property Name	Value
Description:	A flag indicating whether TTS is enabled for the subscriber. Only relevant if TTS enabled in User's COS also.
Notes:	Defaults to 1 (true) so that it is enabled by default, if it is enabled in COS. Values: 0: TTS is disabled for the subscriber 1: TTS is enabled for the subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableTts
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnableVisualMessageLocator

Property Name	Value
Description:	A flag indicating whether the visual message locator feature is enabled for the subscriber.
Notes:	The visual message locator feature presents a list of messages on the subscriber's IP phone display for the subscriber to select from visually.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnableVisualMessageLocator
Primary Key:	False
Allow Null:	False
Default Value:	0

Property Name	Value
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetDontRingPhone

Property Name	Value
Description:	A flag indicating whether a caller is prevented from being transferred to the subscriber phone when the subscriber alternate greeting is turned on.
Notes:	<p>Values:</p> <p>0: Ring the phone.</p> <p>1: Send the caller to the alternate greeting.</p> <p>This setting overrides the subscriber setting to ring the phone.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetDontRingPhone
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetPreventMsg

Property Name	Value
Description:	A flag indicating whether callers can leave a message after the greeting when the subscriber alternate greeting is turned on.

Property Name	Value
Notes:	Values: 0: If alternate greeting is active, callers can leave a message for the subscriber 1: If alternate greeting is active, callers cannot leave a message for the subscriber
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetPreventMsg
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EnAltGreetPreventSkip

Property Name	Value
Description:	A flag indicating whether callers can skip the greeting while it is playing when the alternate greeting is turned on.
Notes:	Values: 0: If alternate greeting is active, callers cannot skip the greeting 1: If alternate greeting is active, callers can skip the greeting
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EnAltGreetPreventSkip
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

EncryptPrivateMessages

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection encrypts messages from the subscriber that are marked private.
Notes:	Values: 0: Do not encrypt private messages. 1: Encrypt private messages. This column only applies to messages marked private.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.EncryptPrivateMessages
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_Action

Property Name	Value
Description:	The type of call action to take, e.g., hang-up, goto another object, etc.
Notes:	Values: 0: Ignore - no action taken. 1: Hangup - the call is immediately terminated. 2: Goto - go to an object such as a call handler, directory handler or interview handler. 3: Error - play the error greeting. 4: Take a message. 5: Skip greeting.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.Action
Primary Key:	False
Allow Null:	False
Default Value:	4
Custom Type:	CallAction

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetConversation

Property Name	Value
Description:	The name of the conversation to which the caller is routed.

Property Name	Value
Notes:	<p>The TargetConversation needs to be set if tbl_CallAction.Action is set to 2 (goto). Conversations, both subscriber and routable, can be created and added to the system dynamically. As such it is not possible to capture a complete list of all possible conversations here. In Unity Connection 2.1(0), the conversations that are included by default are:</p> <ul style="list-style-type: none"> * AD - alpha directory conversation. Sends the call to the specified directory handler. * AttemptForward - attempt forward. Forwards the call if the forwarding station belongs to a subscriber. The calling number is used as the ID, and if the extension is found, the call is forwarded to the subscriber greeting. If the extension is not found, the next rule in the routing table is applied to the call information. * AttemptSignIn - attempt sign-in. Sends the call to the subscriber logon conversation, if the calling number belongs to a subscriber. The calling number is used as the ID. If the call is not from a subscriber, the next rule in the routing table is applied to the call information. * BroadcastMessageAdministrator - broadcast message administrator. * ConvCVMBoxReset - CVM mailbox reset. This is a special conversation for the Community Voice Mail project and is not used in a standard Cisco Unity Connection system. Cisco Unity Connection sends the call to a conversation that allows a subscriber (normally a "Case Worker") to reset a client's mailbox. * ConvHotel - hospitality conversation. When the Cisco Unity Connection Hospitality and Property Management Integration has been installed, this option sends the call to a conversation that allows hotel guests to access archived messages after they have checked out. * ConvUtilsLiveRecord - start live record * EasySignIn - easy sign-in. This is a special subscriber sign in conversation that will log the caller into the mailbox for the greeting being played. This should only be associated with menu entry keys as a rule. * GreetingsAdministrator - greetings administrator (Example, when the office is unexpectedly closed because of bad weather, the owner of a call handler or distribution list can call Cisco Unity Connection from home to enable the alternate Opening Greeting, or rerecord a call handler greeting to state that the office is closed.) * PHGreeting - greeting conversation. Sends the call to the greeting of the specified subscriber. * PHInterview - interview handler conversation. Sends the call to the specified interview handler. * PHTransfer - transfer conversation. Sends the call to the specified call handler. * SubMenu - standard conversation. * SubMenuOpt1 - optional conversation 1. * SubMenu_AlternateN - alternate keypad mapping (N). * SubMenu_AlternateS - alternate keypad mapping (S). * SubMenu_AlternateX - alternate keypad mapping (X). * SubMenu_Alternate_Custom - custom keypad mapping. * SubNotify - message delivery. * SubSignIn - sign-in. Sends the call to the subscriber logon conversation, which prompts the caller to enter an ID. * SubSystemTransfer - subscriber system transfer. Sends the call to a conversation that allows subscribers to transfer to a number that they specify. Subscribers are prompted to log on and then can enter numbers that are not associated with Cisco Unity Connection subscribers such as lobby and conference room phones, and even phone numbers outside the organization. Cisco Unity Connection performs the transfer only when the subscriber restriction table permits it. * SystemTransfer - caller system transfer. Sends the call to a conversation that allows unidentified callers to transfer to a number that they specify. For example, callers may want to dial a lobby or conference room phone that is not associated with a Cisco Unity Connection subscriber. Cisco Unity Connection performs the transfer only when the default system transfer restriction table permits it. * VuiStart - voice recognition.

Property Name	Value
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_CallAction.TargetConversation
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ConversationName
SQL Data Type/Length:	nvarchar (64 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character (Unicode and ASCII).
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	64 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Exit_TargetHandlerObjectId

Property Name	Value
Description:	The unique identifier of the specific object to send along to the target conversation.
Notes:	Depending on which conversation is the target as specified by the TargetConversation column, the type of object specified here will differ. See the TargetConversation column for more information.
Business Rules:	The default value should be the objectId of the "Goodbye" call handler.
Developer Notes:	Looks like this links to one of the Handlers always, so we should be able to change TargetObjectId to HandlerObjectId and remove the TargetObjectIdType column.
Table/Column Mapping:	tbl_CallAction.TargetHandlerObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

ExitCallActionObjectId

Property Name	Value
Description:	The unique identifier of the CallAction object that is taken when a caller exits the subscriber conversation by pressing the * key or timing out.
Notes:	The default value for this column should be the object id of the call action associated with sending the call to the "Opening Greeting" call handler.
Business Rules:	
Developer Notes:	This one column replaces the ExitAction, ExitObjectId and ExitObjectType columns that were in the SubscriberTemplate table prior to Unity 5.x.
Table/Column Mapping:	tbl_UserSubscriber.ExitCallActionObjectId
Primary Key:	False
Allow Null:	False
Default Value:	
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

FirstDigitTimeout

Property Name	Value
Description:	The amount of time to wait (in milliseconds) for first digit when collecting touch tones.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.FirstDigitTimeout
Primary Key:	False
Allow Null:	False
Default Value:	5000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	500

Property Name	Value
Validation - Maximum Value:	10000

ForcedAuthorizationCode

Property Name	Value
Description:	A valid authorization code that is entered prior to extending calls to classes of dialed numbers, for example, external, toll and international calls.
Notes:	This applies only to subscribers with the personal call routing rules feature enabled.
Business Rules:	Subscriber must have personal call routing rules enabled in their COS.
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ForcedAuthorizationCode
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ForcedAuthorizationCode
SQL Data Type/Length:	varchar (40 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	1 characters
Validation - Maximum Length:	40 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

GreetByName

Property Name	Value
Description:	A flag indicating whether the subscriber hears his/her name when they log into their mailbox over the phone.
Notes:	Values: 0: Do not play the name. 1: Play the recorded voice name.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.GreetByName
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool

Property Name	Value
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

InboxAutoRefresh

Property Name	Value
Description:	The rate (in minutes) at which Unity Inbox performs a refresh.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxAutoRefresh
Primary Key:	False
Allow Null:	False
Default Value:	15
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	999

InboxAutoResolveMessageRecipients

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection automatically resolves a recipient address entered in the To, Cc or Bcc fields to a subscriber or distribution list. Known as the "AutoResolve" feature.

Property Name	Value
Notes:	<p>AutoResolve maps a recipient address entered in the To, Cc or Bcc fields, in any of the below supported addressing formats, to a subscriber or distribution list or private list, without requiring the intervention of the user.</p> <ul style="list-style-type: none"> * Subscriber Alias (Example: hsimpson) * Subscriber DisplayName (Example: Homer Simpson) * Subscriber LastName, FirstName (Example: Simpson, Homer) * Subscriber LastName FirstName (Example: Simpson Homer) * Subscriber FirstName, LastName (Example: Homer, Simpson) * Subscriber FirstName LastName (Example: Homer Simpson) * Subscriber Extension (Example: 46637) * DistributionList DisplayName (Example: All Subscribers - UNITY1) * DistributionList Alias (Example: allsubscribers) * DistributionList Extension (Example: 99991) * PrivateList DisplayName (Example: Unity Clients Team) * BlindAddress (Example: VPIM:101_59181, somebody@somedomain.com) <p>If AutoResolve is disabled, the user will always be prompted to resolve recipient addresses.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxAutoResolveMessageRecipients
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

InboxMessagesPerPage

Property Name	Value
Description:	The number of messages Unity Inbox displays in a page.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InboxMessagesPerPage
Primary Key:	False
Allow Null:	False

Property Name	Value
Default Value:	20
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1
Validation - Maximum Value:	99

InterdigitDelay

Property Name	Value
Description:	The amount of time to wait (in milliseconds) for input between touch tones when collecting digits in TUI.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.InterdigitDelay
Primary Key:	False
Allow Null:	False
Default Value:	3000
Custom Type:	
SQL Data Type/Length:	int (4 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	1000
Validation - Maximum Value:	10000

IsClockMode24Hour

Property Name	Value
Description:	The time format used for the message timestamps that the subscriber hears when they listen to their messages over the phone.

Property Name	Value
Notes:	<p>Possible Values:</p> <p>0: 12-Hour clock - The subscriber hears message timestamps in the time format of a 12-hour clock. For example, a subscriber will hear 1:00 PM when listening to the timestamp of a message left at 1:00 PM.</p> <p>1: 24-Hour clock - The subscriber hears message timestamps in the time format of a 24-hour clock. For example, a subscriber will hear 13:00 when listening to the timestamp of a message left at 1:00 PM.</p>
Business Rules:	
Developer Notes:	Previously this column contained three possible values, 12 hour, 24 hour, and a third value that signified use the system default setting. In Cisco Unity Connection, the "use system default setting" has been dropped. The 12/24 hour clock must be set for each user.
Table/Column Mapping:	tbl_UserSubscriber.IsClockMode24Hour
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsSetForVmEnrollment

Property Name	Value
Description:	Temporary placeholder until IsVmEnrolled can be phased out. At that point, delete this column and rename tbl_UserSubscriber.IsVmEnrolled to IsSetForVmEnrollment.
Notes:	<p>Values:</p> <p>0: The enrollment conversation is not played for the subscriber when they login</p> <p>1: The enrollment conversation is played for the subscriber when they login</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.IsVmEnrolled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	

Property Name	Value
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

IsVmEnrolled

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection plays the enrollment conversation (record a voice name, indicate if they are listed in the directory, etc.) for the subscriber when they login.
Notes:	Values: 0: The enrollment conversation is not played for the subscriber when they login 1: The enrollment conversation is played for the subscriber when they login
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.IsVmEnrolled
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	
Validation - Maximum Length:	
Validation - Minimum Value:	
Validation - Maximum Value:	

JumpToMessagesOnLogin

Property Name	Value
Description:	A flag indicating whether the subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.

Property Name	Value
Notes:	Subscribers will not hear message counts, their own name, top level menus, etc when this setting is active. Values: 0: Subscriber conversation does not jump directly to first message in the message stack after subscriber sign-in. 1: Subscriber conversation jumps directly to the first message in the message stack after subscriber sign-in.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.JumpToMessagesOnLogin
Primary Key:	False
Allow Null:	False
Default Value:	0
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)
Validation - Expression:	
Validation - Description:

Language

Property Name	Value
Description:	The preferred language of this user. For a user with a voice mailbox, it is the language in which the subscriber hears instructions played to them. If the subscriber has TTS enabled by their COS, it is the language used for TTS.

Property Name	Value
Notes:	<p>NULL is not allowed because the subscriber language cannot be inherited. See customtype "LanguageCode" for more information.</p> <p>There is another language value for a subscriber that outside callers hear when they call this subscriber. This is set on the primary call handler for this subscriber and CAN be set to NULL for Inherited.</p> <p>Values:</p> <p>10241: Arabic_Syria 10241 10249: English_Belize 10249 1025: Arabic_Saudi_Arabia 1025 10250: Spanish_Peru 10250 1026: Bulgarian 1026 1027: Catalan 1027 1028: Chinese_Taiwan 1028 1029: Czech 1029 1030: Danish 1030 1031: German_Standard 1031 1032: Greek 1032 1033: English_United_States 1033 1034: Spanish_Traditional_Sort 1034 1035: Finnish 1035 1036: French_Standard 1036 1037: Hebrew 1037 1038: Hungarian 1038 1039: Icelandic 1039 1040: Italian_Standard 1040 1041: Japanese 1041 1042: Korean 1042 1043: Dutch_Standard 1043 1044: Norwegian_Bokmal 1044 1045: Polish 1045 1046: Portuguese_Brazilian 1046 1047: Rhaeto-Romanic 1047 1048: Romanian 1048 1049: Russian 1049 1050: Croatian 1050 1051: Slovak 1051 1052: Albanian 1052 1053: Swedish 1053 1054: Thai 1054 1055: Turkish 1055 1056: Urdu 1056 1057: Indonesian 1057 1058: Ukrainian 1058 1059: Belarusian 1059 1060: Slovenian 1060 1061: Estonian 1061 1062: Latvian 1062 1063: Lithuanian 1063 1065: Farsi 1065 1066: Vietnamese 1066 1067: Armenian 1067 1068: Azeri_Latin 1068 1069: Basque 1069</p>

ListInDirectory

Property Name	Value
Description:	A flag indicating whether Cisco Unity Connection should list the subscriber in the phone directory for outside callers.
Notes:	<p>If the user is listed in the phone directory AND has a recorded voice name, outside callers can find this user by spelling their name when using a directory handler (NameLookupHandler). This value has no effect on other users addressing this user by name.</p> <p>Values: 0: Do not list the subscriber in the phone directory. 1: List the subscriber in the phone directory.</p>
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserSubscriber.ListInDirectory
Primary Key:	False
Allow Null:	False
Default Value:	1
Custom Type:	Bool
SQL Data Type/Length:	smallint (2 bytes)

MailboxDn

Property Name	Value
Description:	The distinguished name of the mailbox.
Notes:	Identifies a mailbox in foreign email system for use in synchronizing information stored there, such as calendar information for personal rules.
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_User.MailboxDn
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	
SQL Data Type/Length:	lvarchar (392 characters)
Validation - Expression:	^[^\x00-\x1F\x7F]*\$
Validation - Description:	Any character except non-printing ASCII characters.
Validation - Minimum Length:	0 characters
Validation - Maximum Length:	392 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

MailboxStoreObjectId

Property Name	Value
Description:	The unique identifier of the MailboxStore object where a mailbox is created for a new subscriber created with this template.
Notes:	
Business Rules:	
Developer Notes:	
Table/Column Mapping:	tbl_UserTemplate.MailboxStoreObjectId
Primary Key:	False
Allow Null:	True
Default Value:	NULL
Custom Type:	ObjectID
SQL Data Type/Length:	char (36 characters)
Validation - Expression:	
Validation - Description:	
Validation - Minimum Length:	36 characters
Validation - Maximum Length:	36 characters
Validation - Minimum Value:	
Validation - Maximum Value:	

Manager

Property Name	Value
Description:	The name of the person who is the manager or supervisor of the user.
